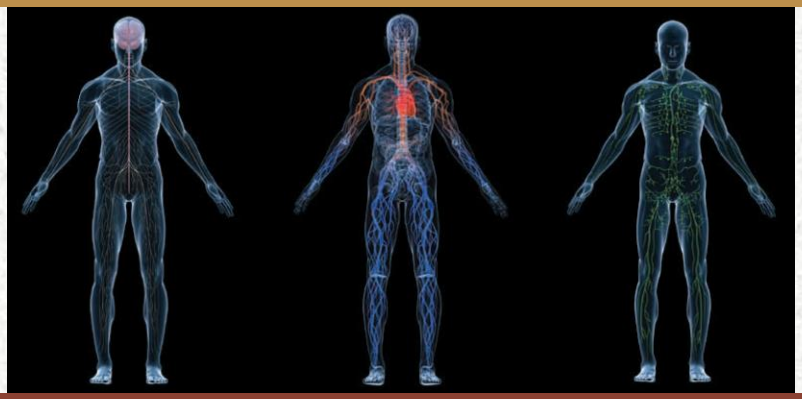
GUYTON AND HALL *Textbook of*

Medical Physiology

TWELFTH EDITION



Chapter 29:

Renal Regulation of Potassium, Calcium, Phosphate, and Magnesium; Integration of Renal Mechanisms for Control of Blood Volume and Extracellular Fluid Volume

Normal potassium intake, distribution, and output from the body.

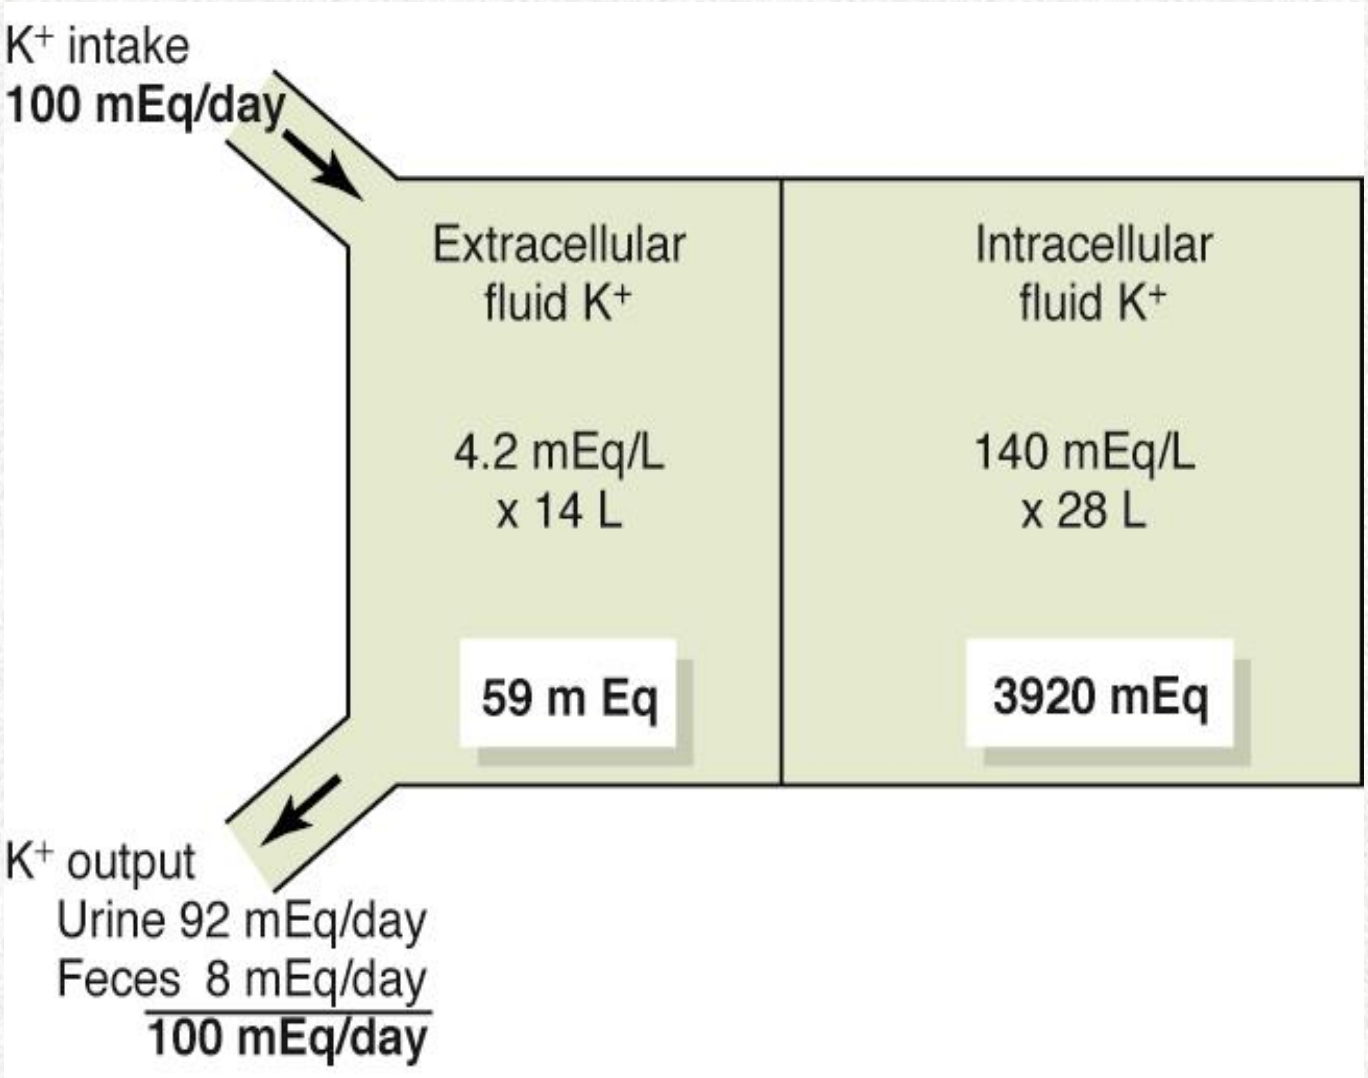


Figure 29-1

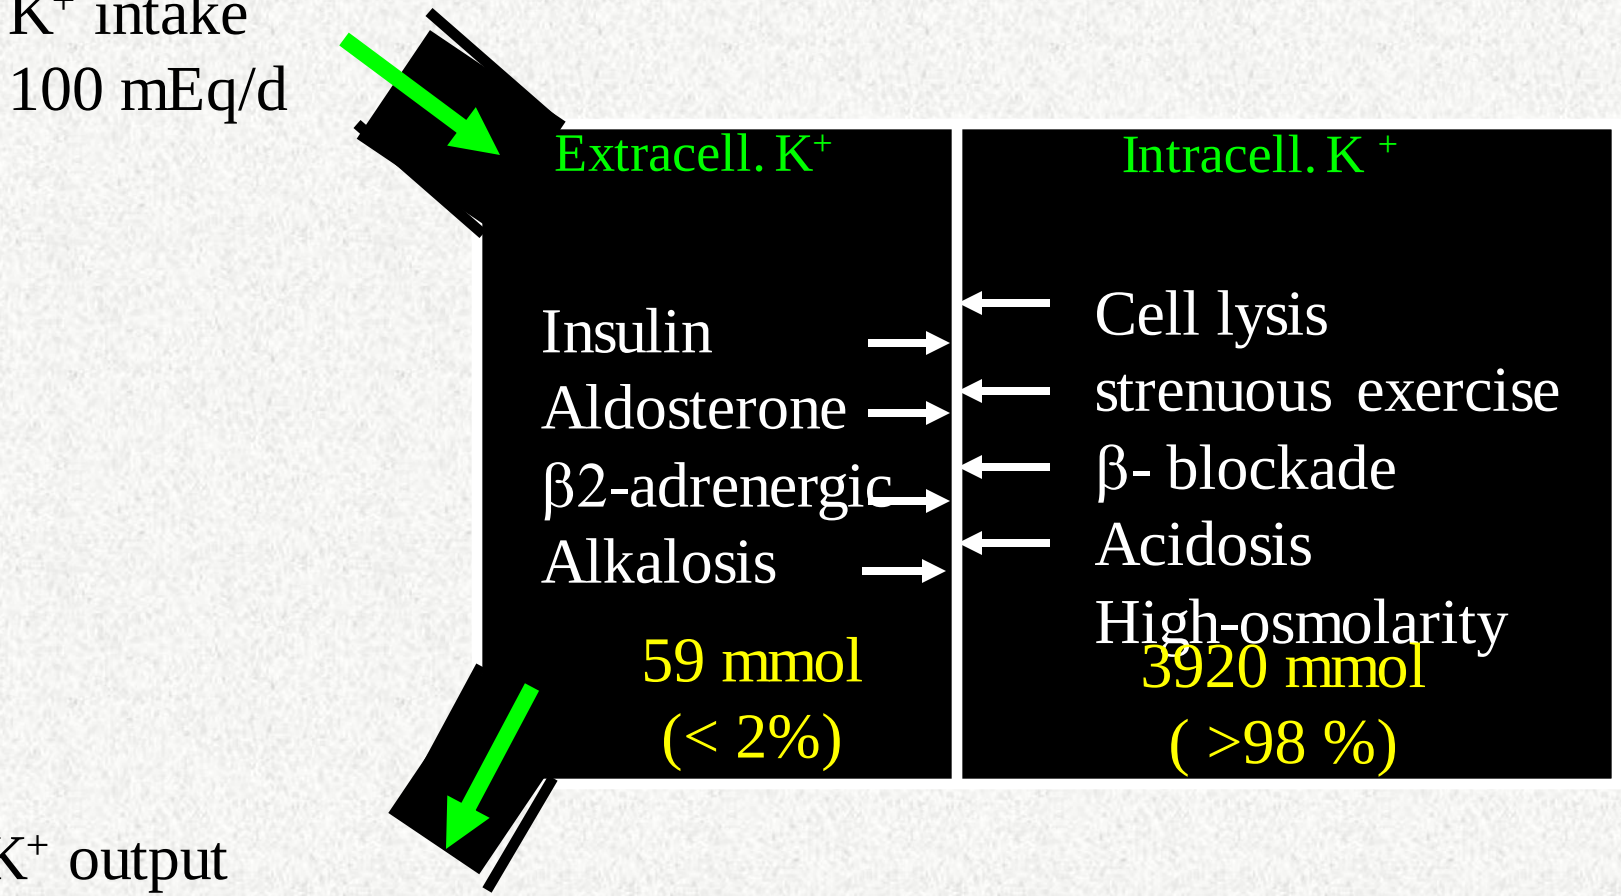
Effects of severe hyperkalemia

- Partial depolarization of cell membranes
- Cardiac toxicity
  ventricular fibrillation or asystole

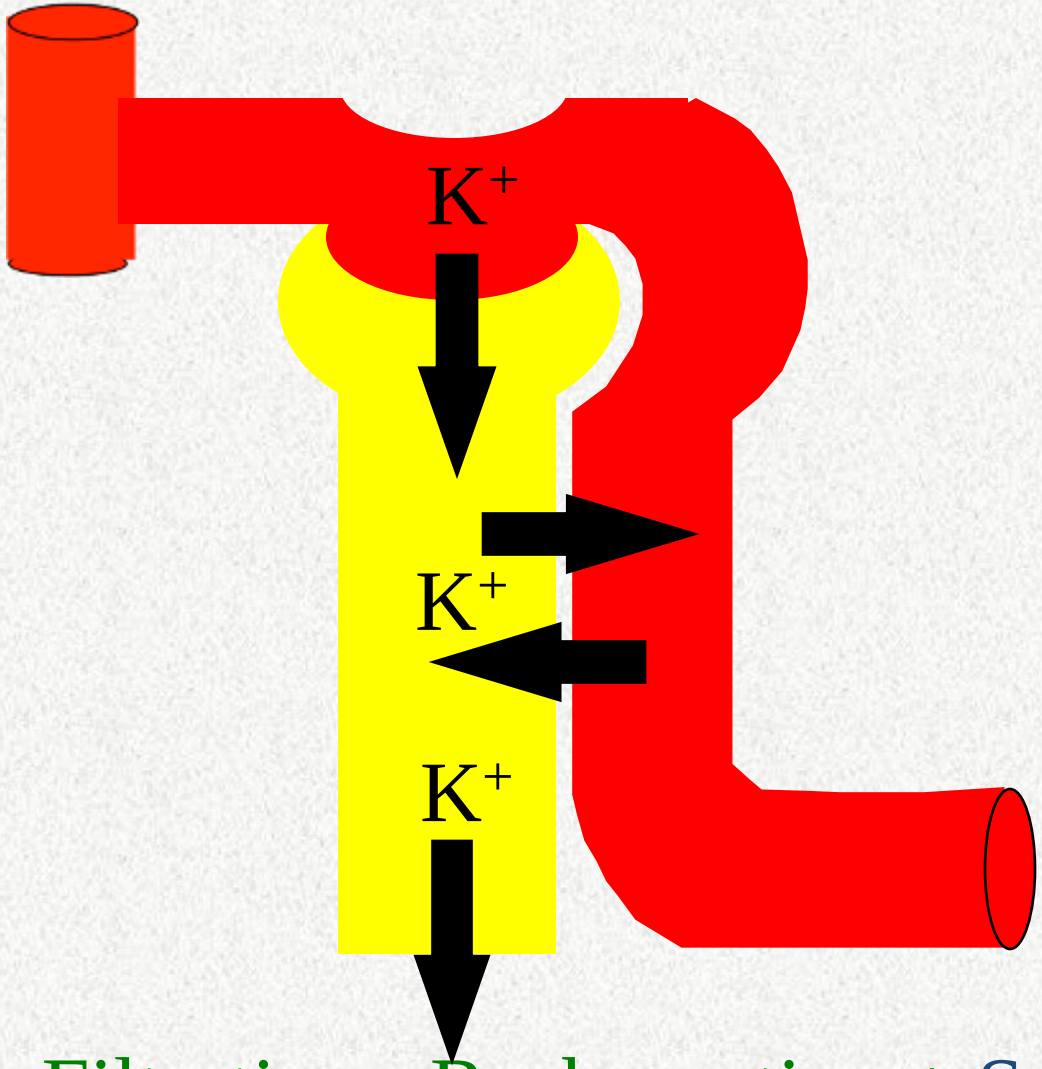
Effects of severe hypokalemia

- Hyperpolarization of cell membranes
- Fatigue, muscle weakness
- hypoventilation
- delayed ventricular repolarization

Potassium Regulation: Internal and External



Control of Potassium Excretion



Excretion = Filtration - Reabsorption + Secretion

Renal tubular sites of potassium reabsorption and secretion.

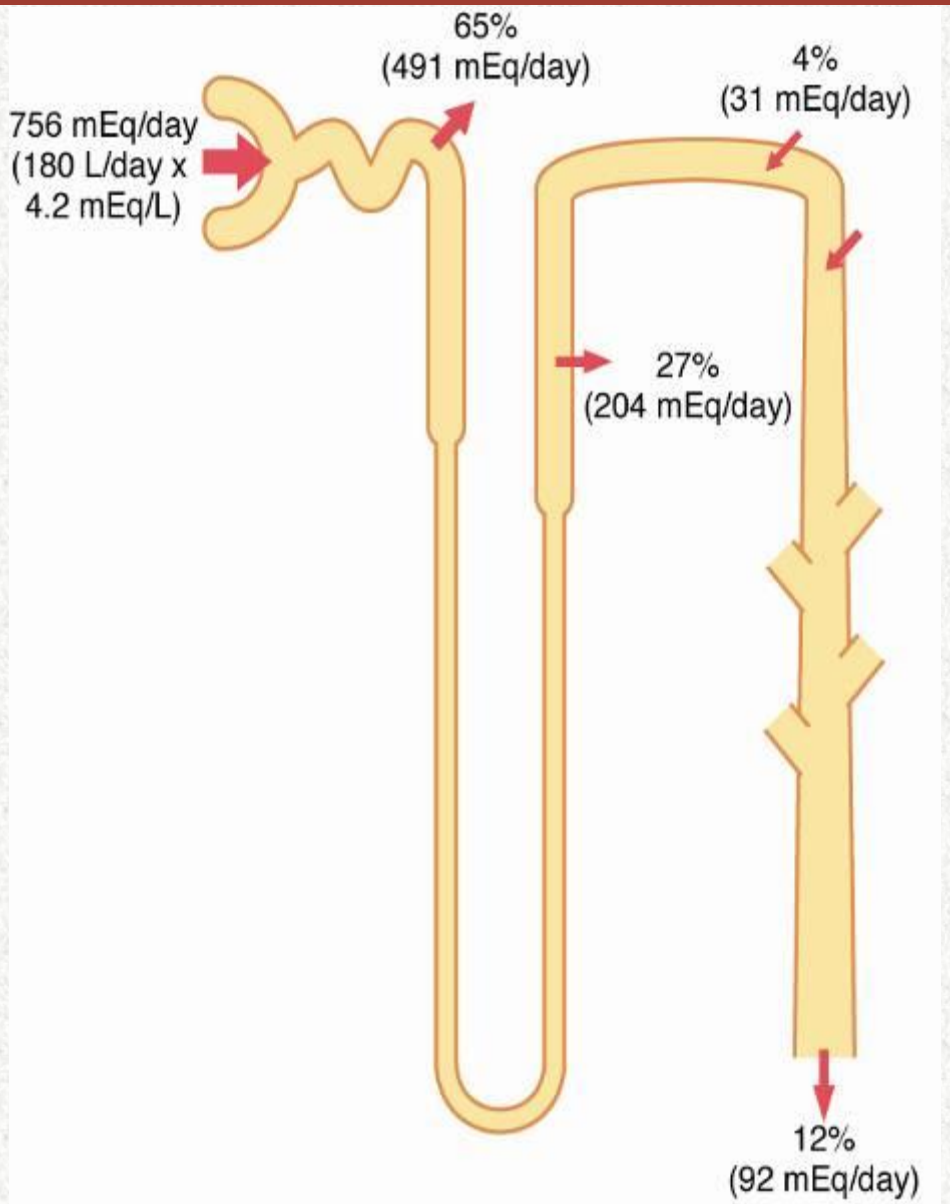


Figure 29-2

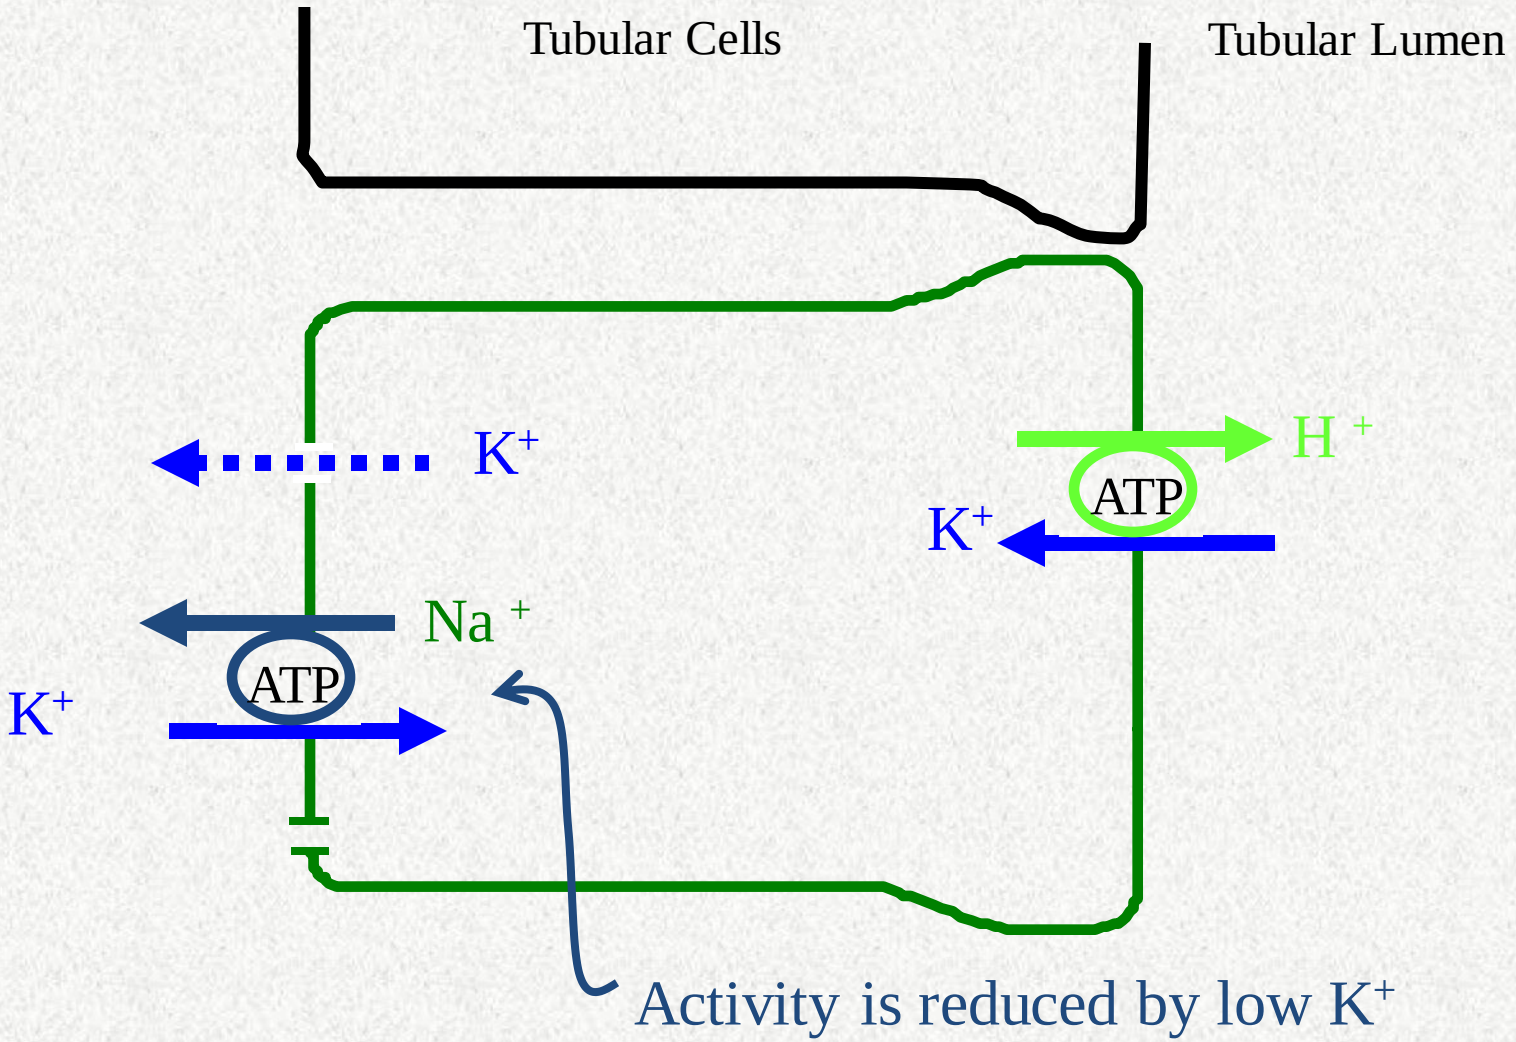
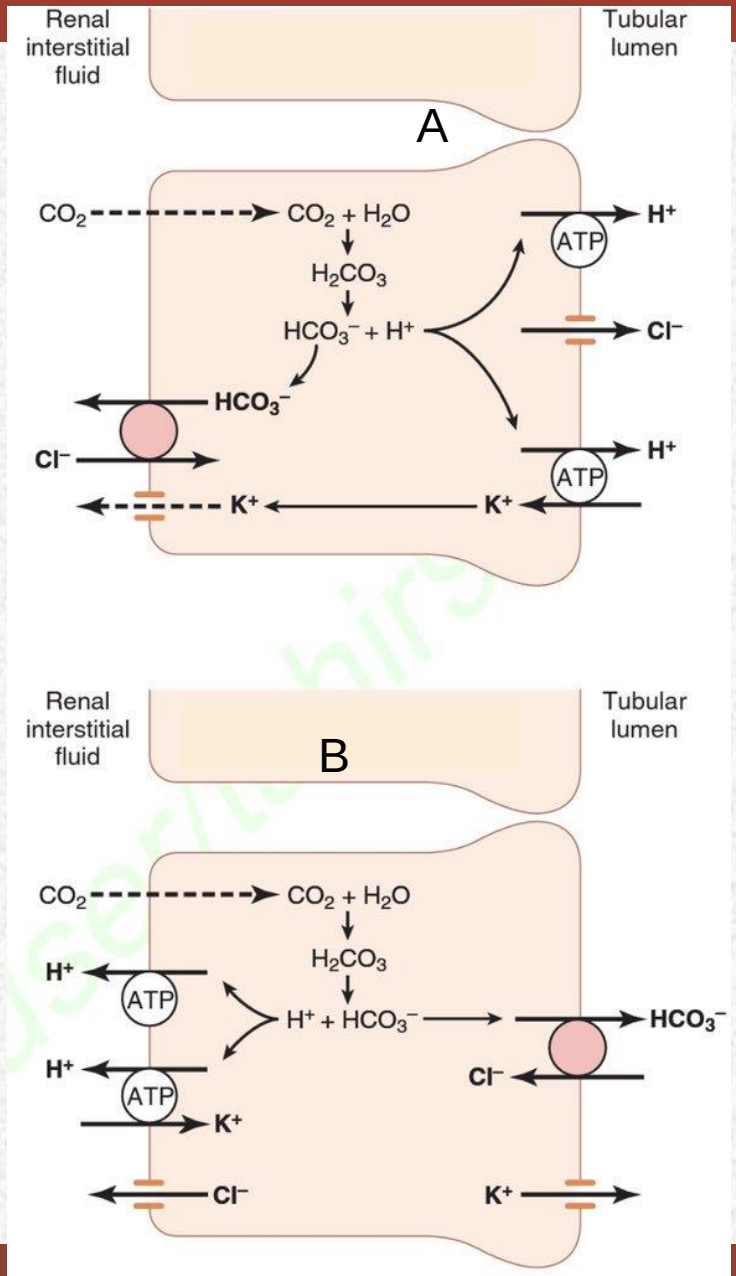
Late Distal and Cortical Collecting Tubules
Intercalated Cells –Reabsorb K^+





Potassium Secretion by Principal Cells

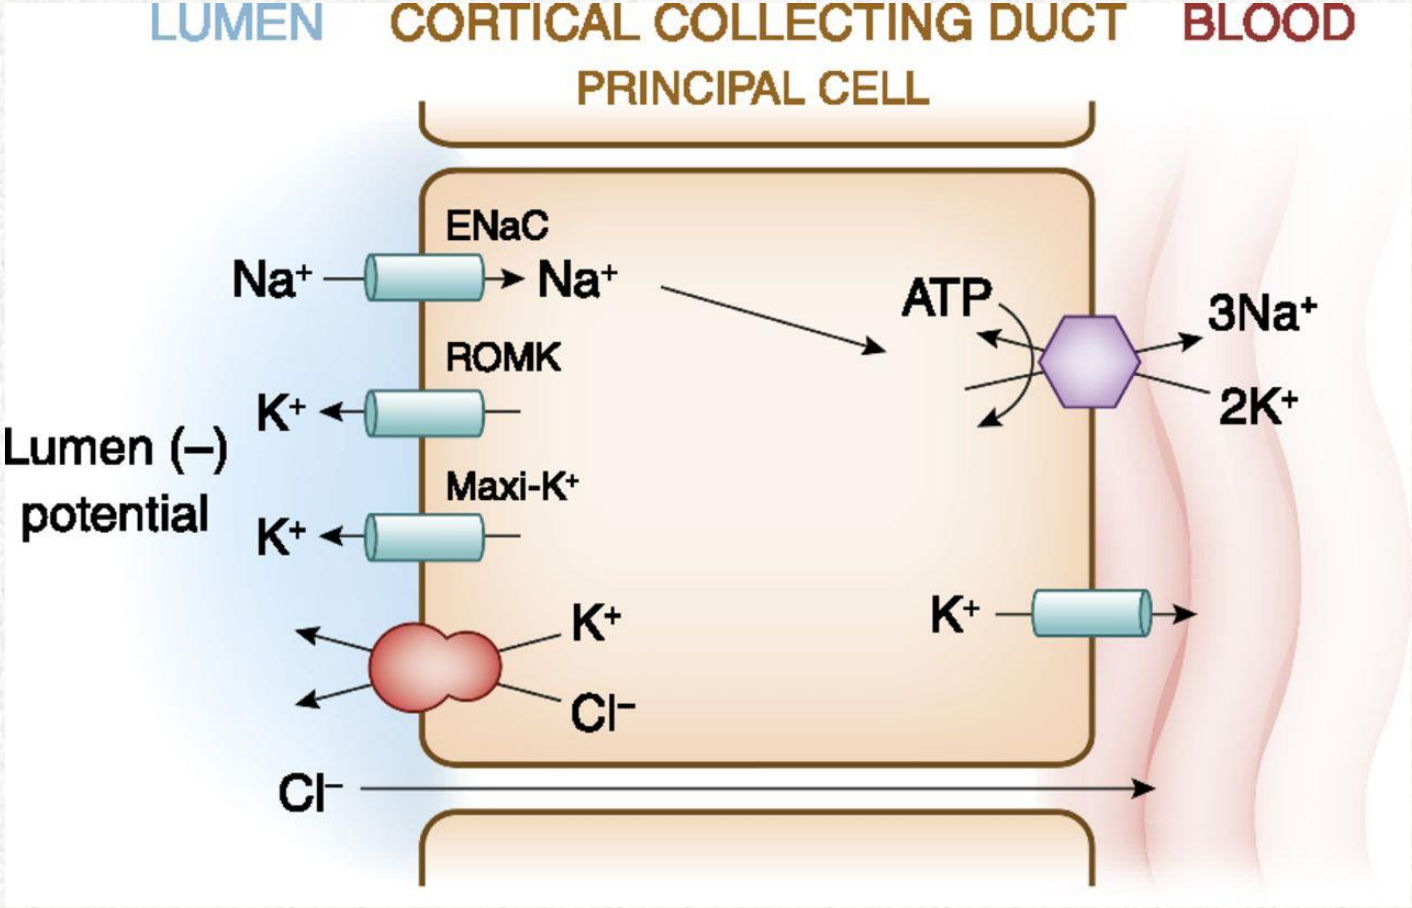


Figure 29-3

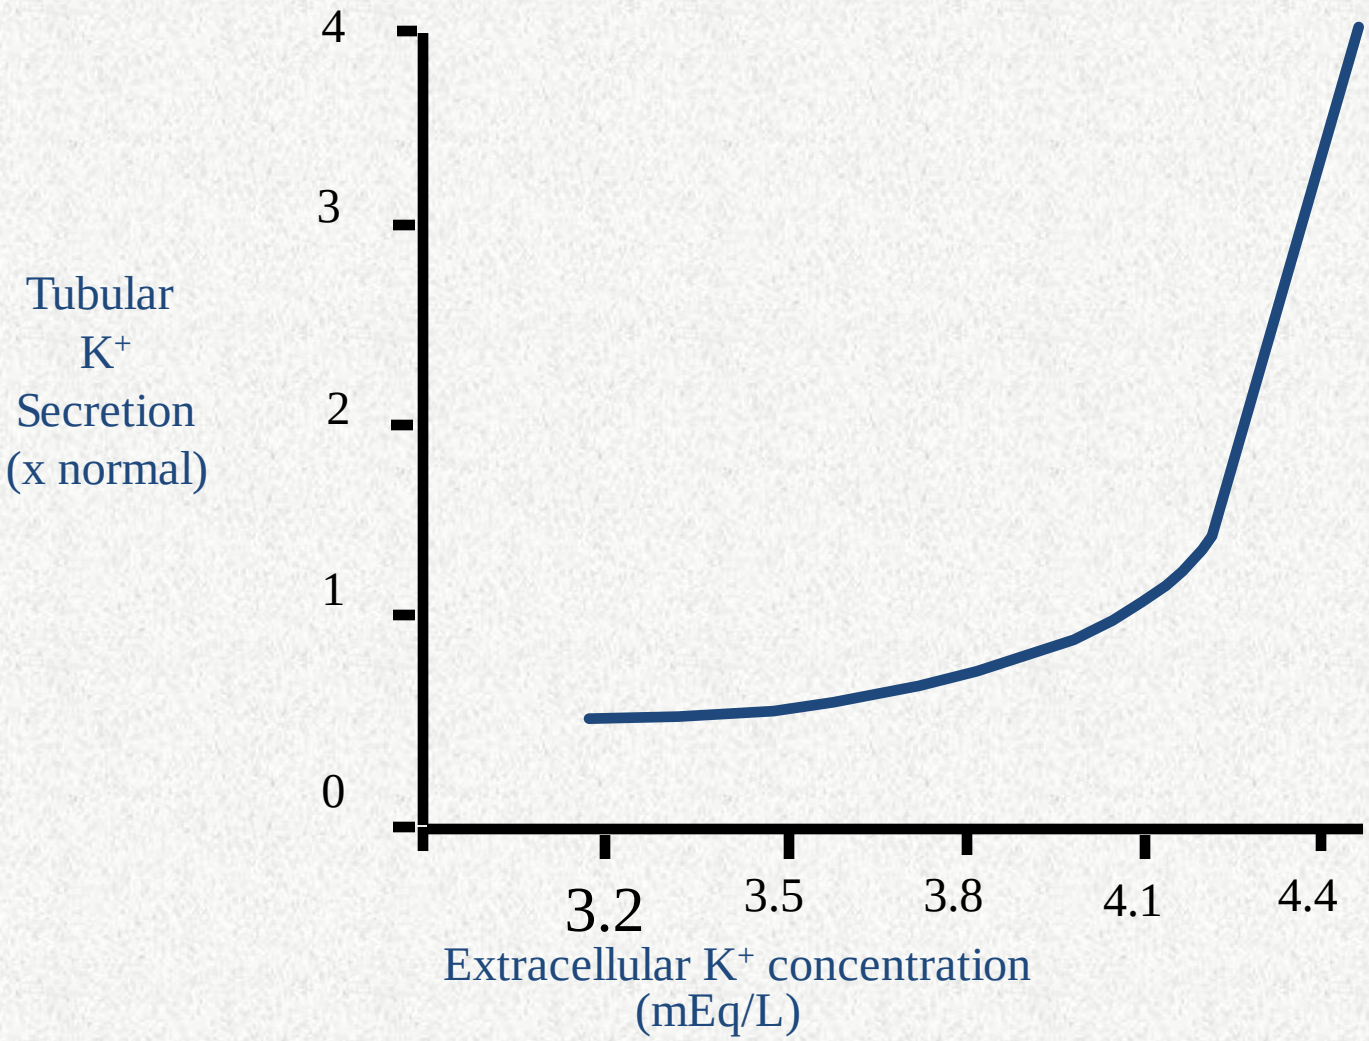
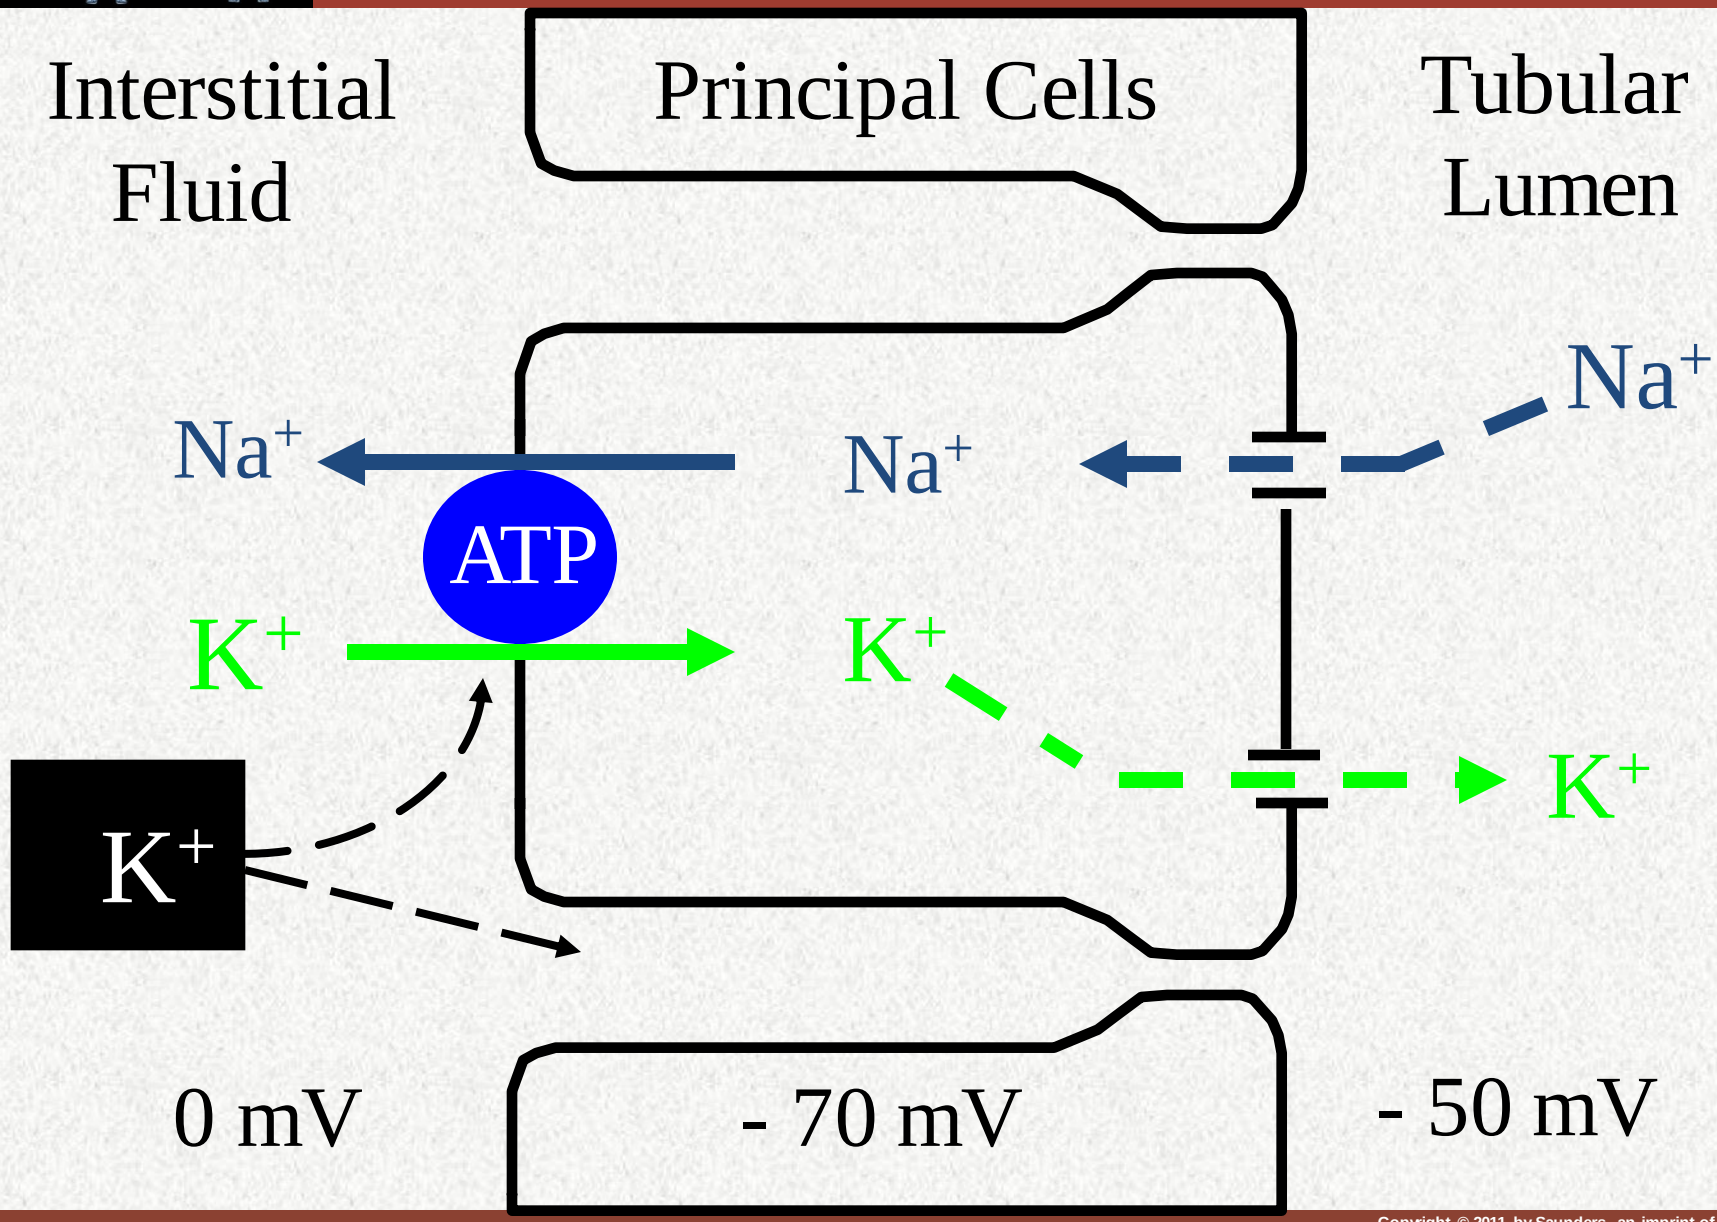
Control of Cortical Collecting Tubule (Principal Cells) K^+ Secretion

- Extracellular K^+ concentration :
  - Increases K^+ secretion: pump, gradient, aldo
- Aldosterone : increases K^+ secretion (pump+perm)
- Sodium (volume) delivery : increases K^+ secretion
- Acid - base status:
  - acidosis : decreases K^+ secretion
  - alkalosis : increases K^+ secretion

Effect of Extracellular K^+ on Excretion of K^+





Increased serum K^+ stimulates aldosterone secretion

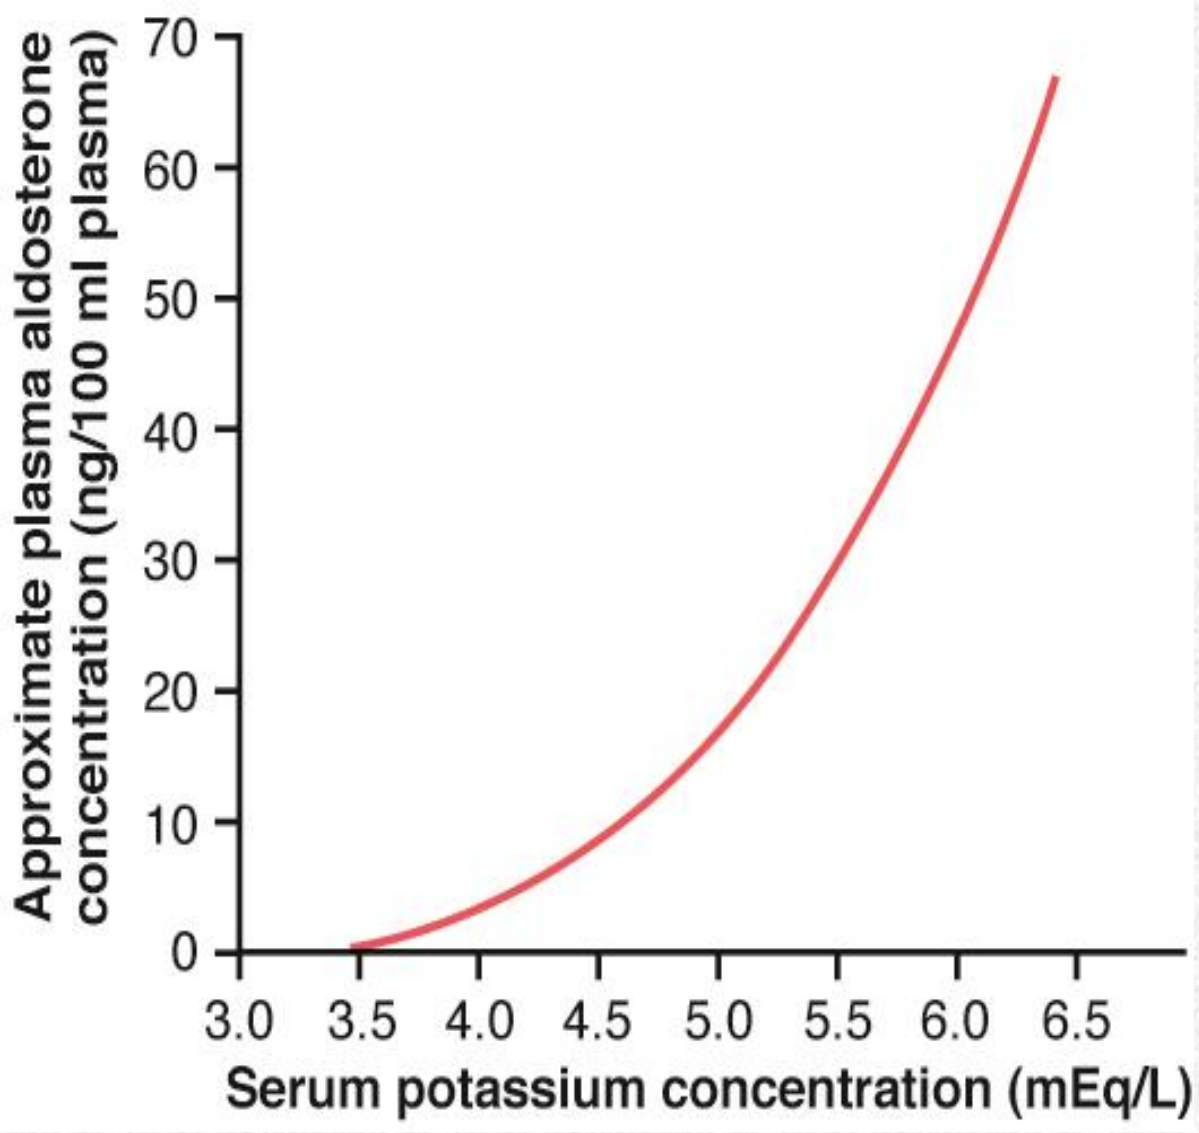


Figure 29-5

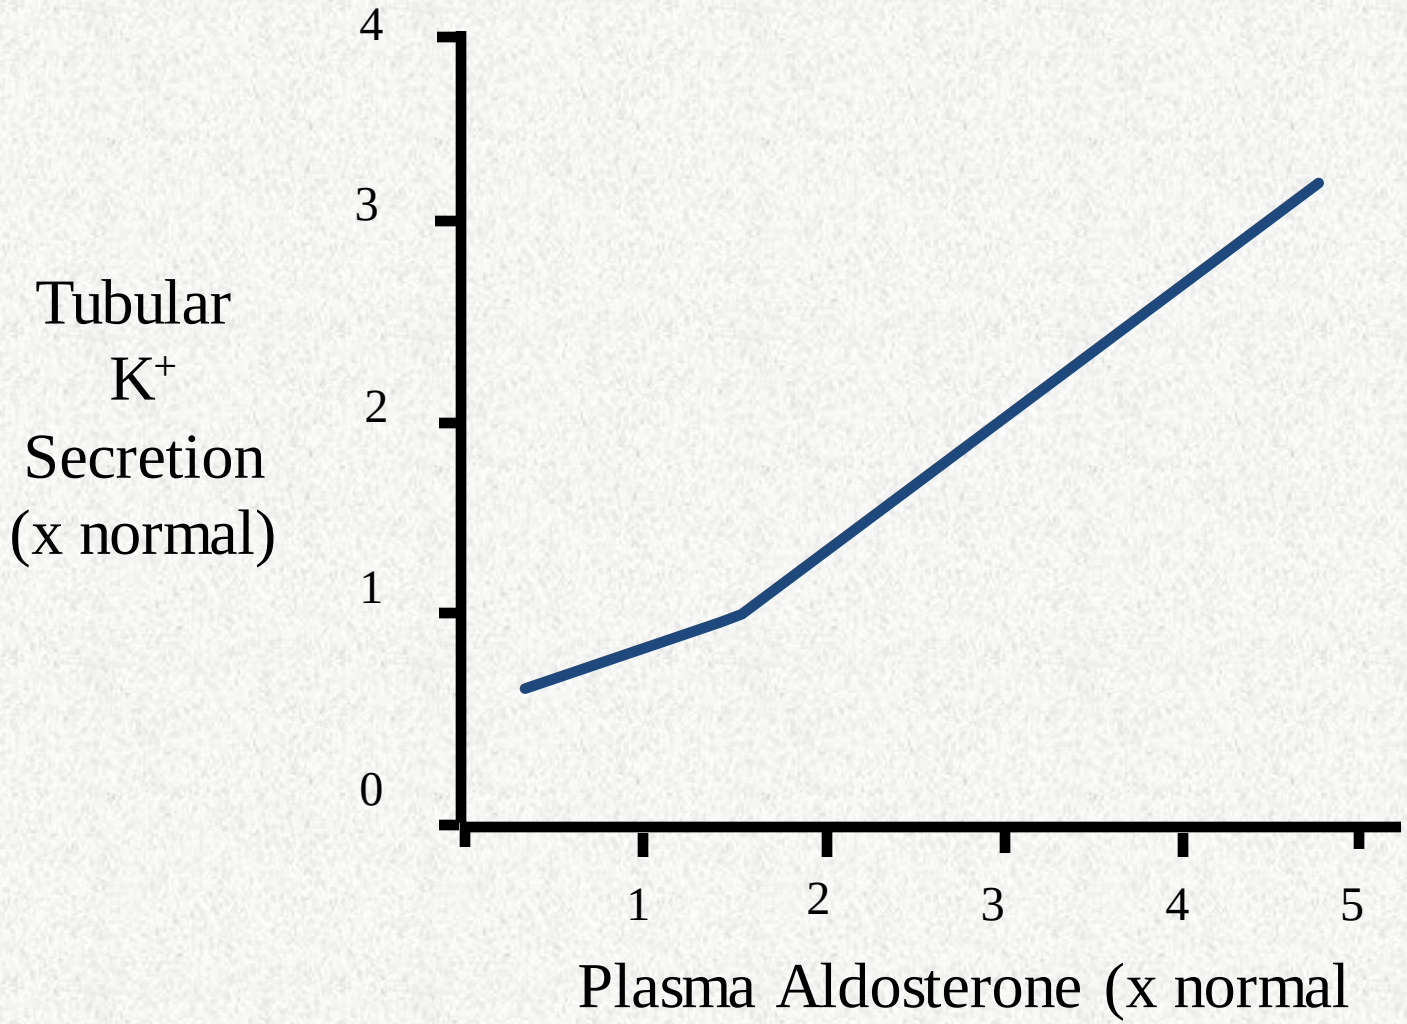
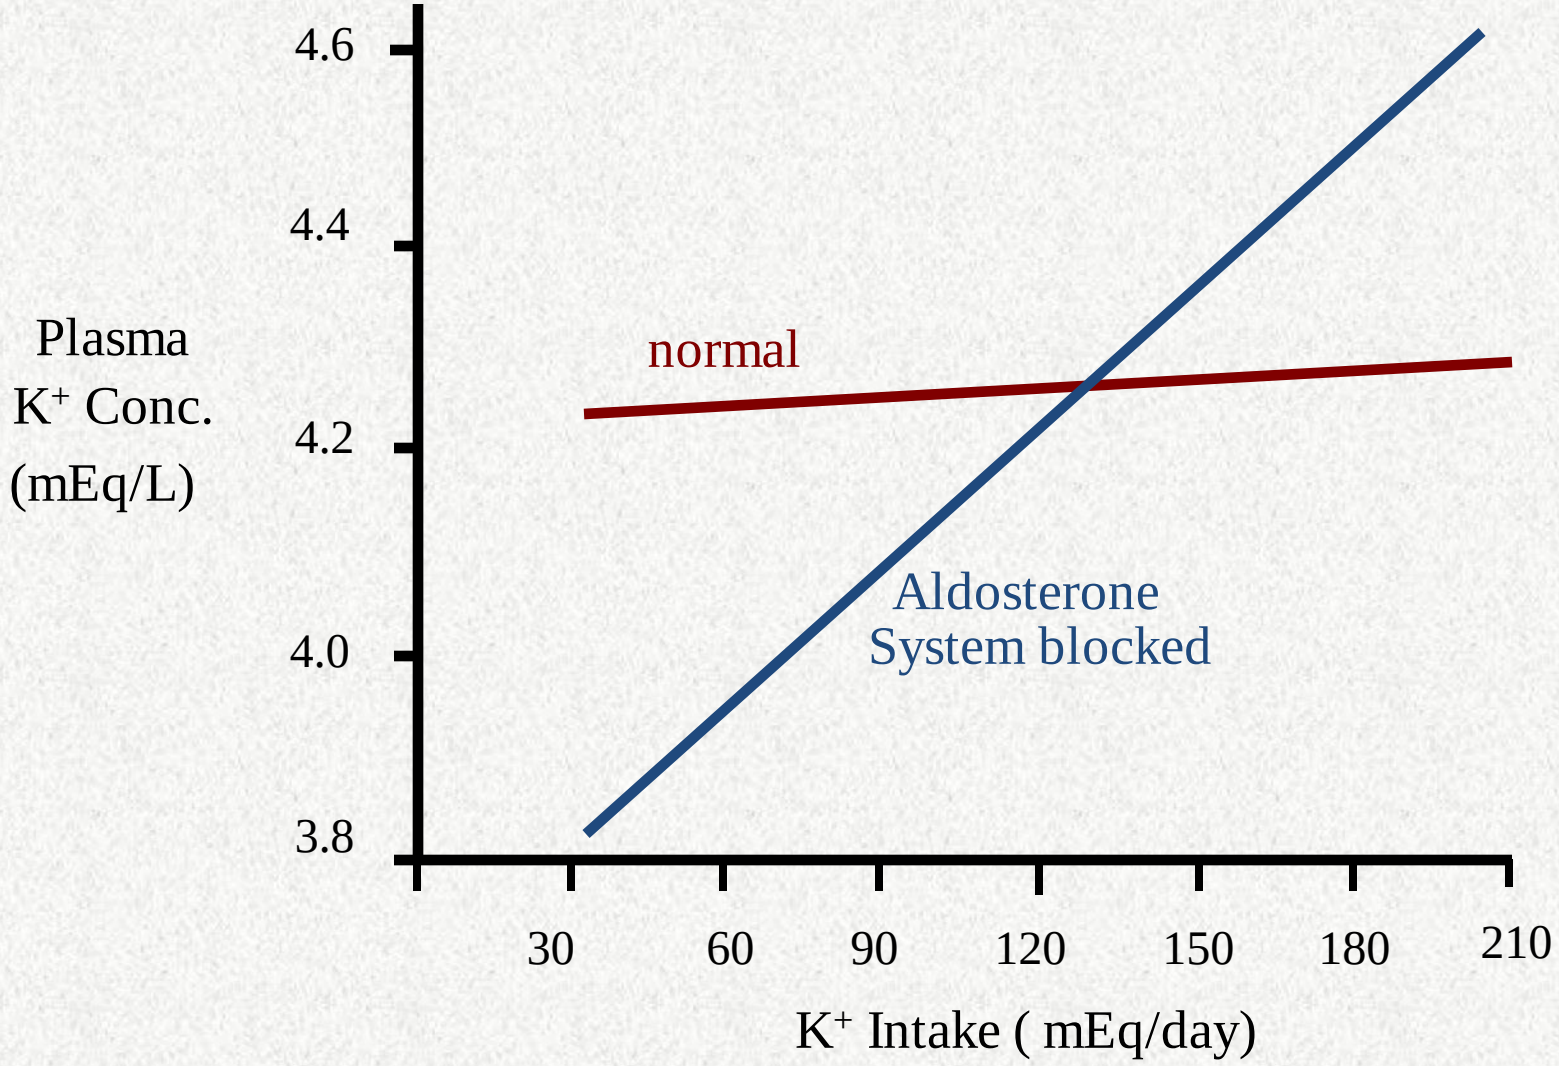
Effect of Aldosterone on K^+ Excretion



Effect of Changes in K^+ Intake on Plasma K^+ After Blocking Aldosterone System



Effect of collecting tubule flow rate on K^+ secretion

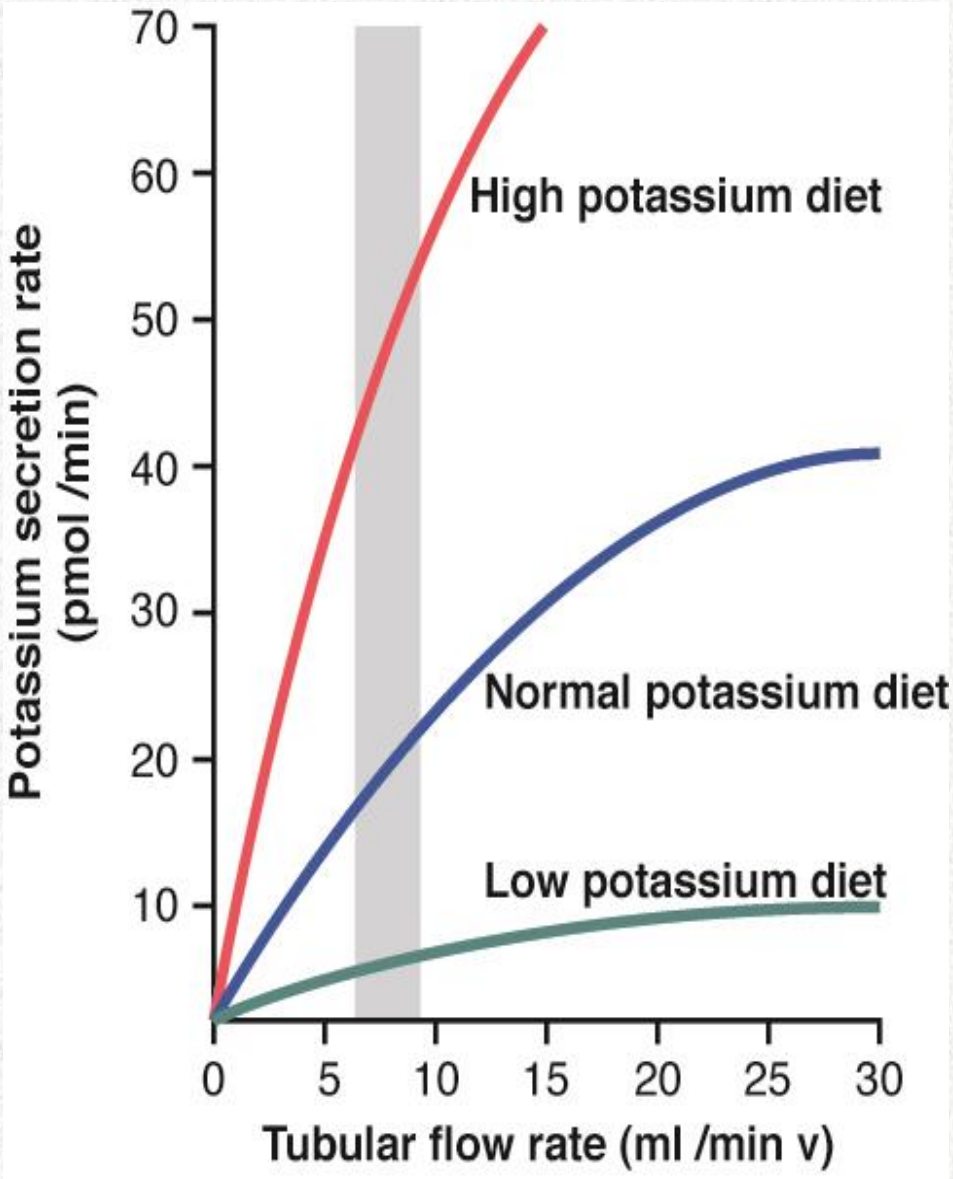


Figure 29-9

Diuretics that ↓ Prox. or ↓ Loop Na^+ Reabsorption

↓ Water Reabsorption

↓ Volume Delivery to Cort. Collect. Tub.

↑ Cell : Lumen Gradient for K^+ Diffusion

↑ K^+ Secretion

K^+ Depletion

↓ K^+ Reabsorption

↑ Na^+ Intake

↓ Aldosterone

↑ GFR

↓ Proximal Tubular Na^+ Reabsorption

⊖

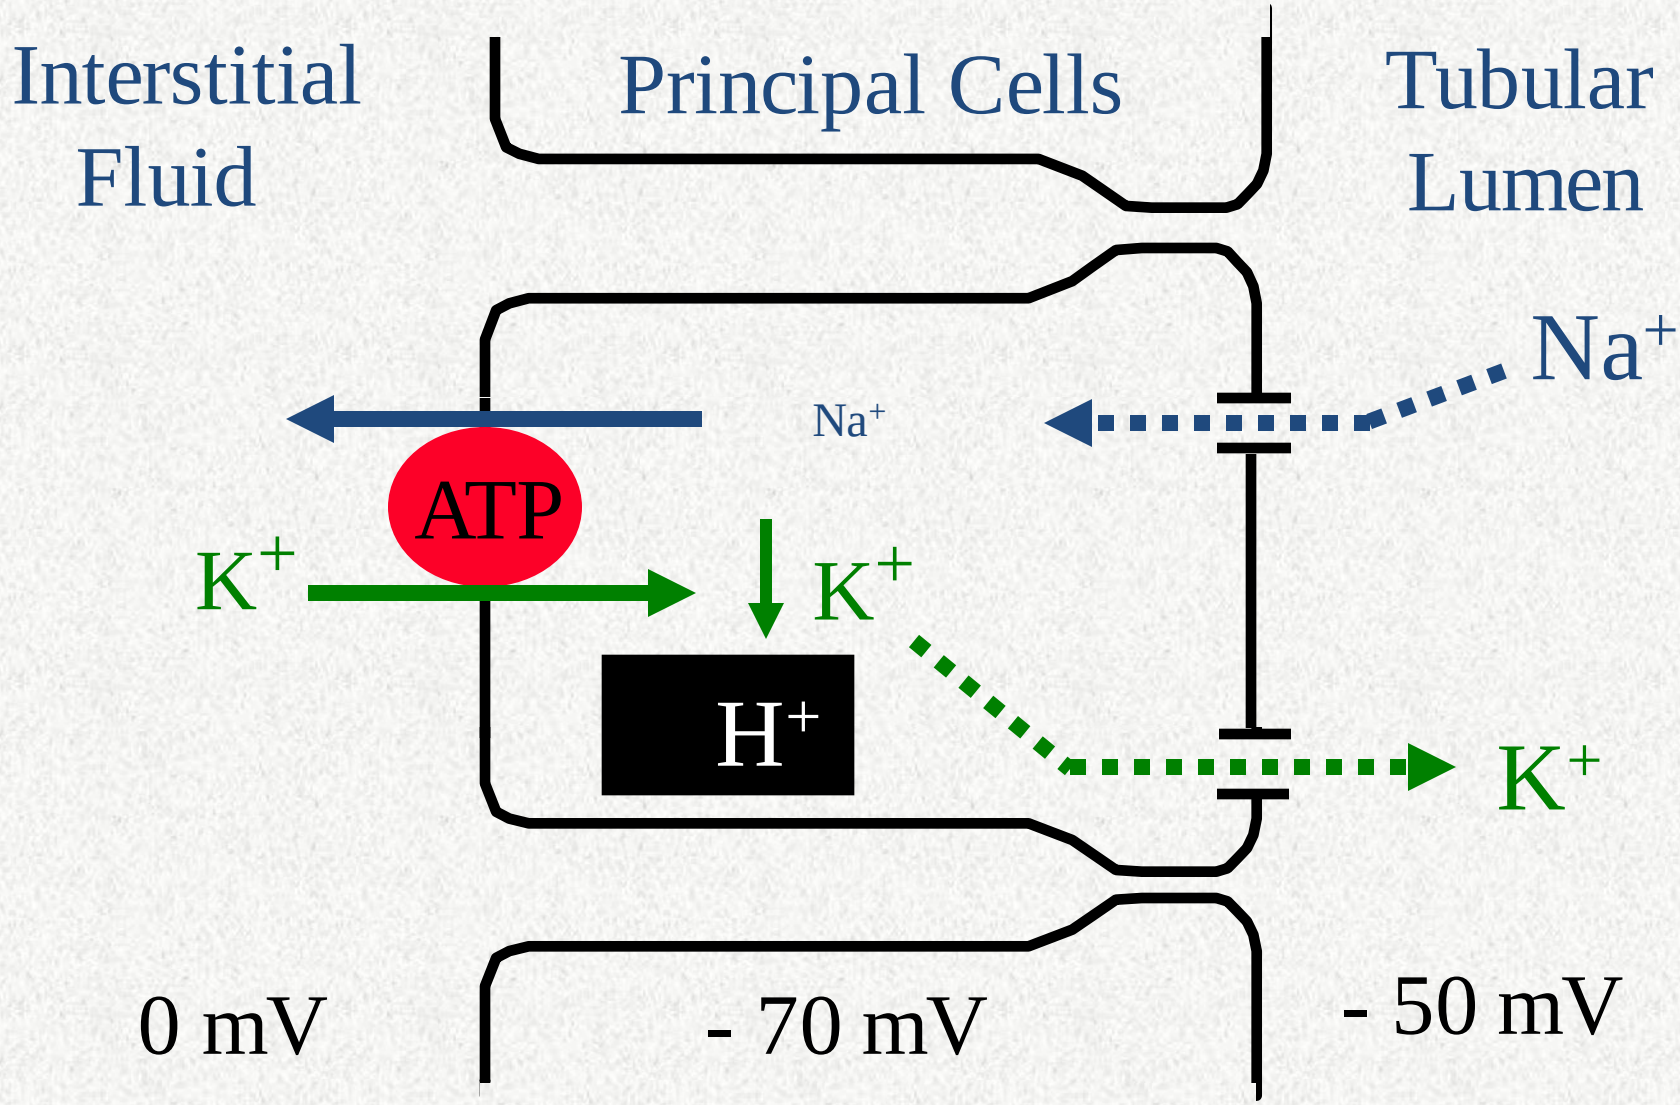
↑ K^+ Secretion Cort. Collect.Ducts

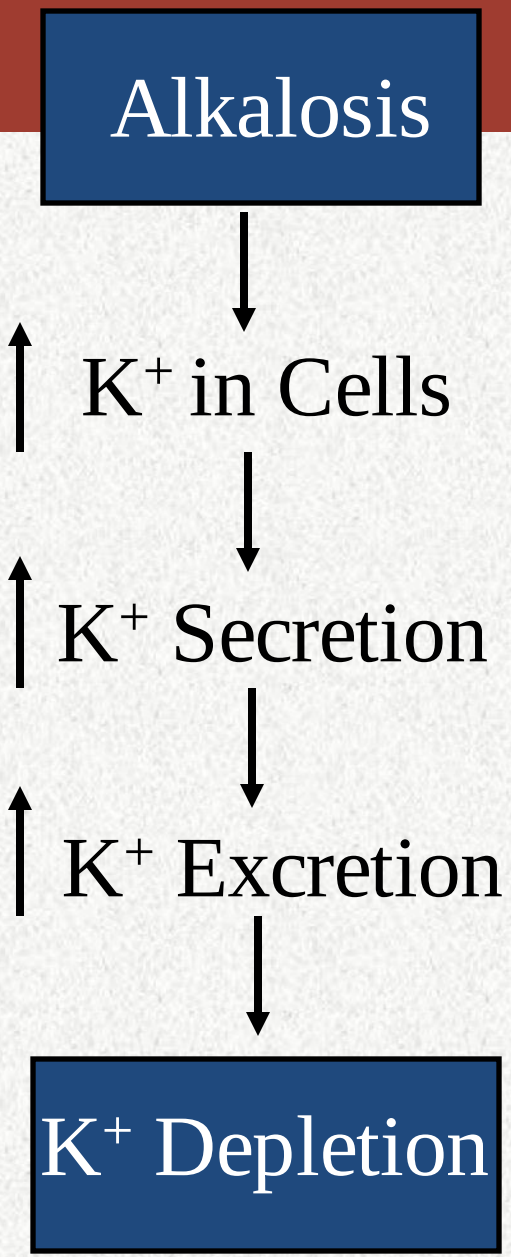
⊖

↑ Distal Tubular Flow Rate

Unchanged K^+ Excretion

Acute Acidosis Decreases Cell K^+





Causes of Hyperkalemia

- Renal failure
- Decreased distal nephron flow (heart failure, severe volume depletion, NSAID, etc)
- Decreased aldosterone or decreased effect of aldosterone
  - adrenal insufficiency
  - K^+ sparing diuretics (spironolactone, eplerenone)
- Metabolic acidosis (hyperkalemia is mild)
- Diabetes (kidney disease, acidosis ↓ insulin)

Causes of Hypokalemia

- Very low intake of K^+
- GI loss of K^+ - diarrhea
- Metabolic alkalosis
- Excess insulin
- Increased distal tubular flow /
  - salt wasting nephropathies
  - osmotic diuretcs
  - loop diuretics
- Excess aldosterone or other mineralocorticoids

Compensatory responses to decreased plasma ionized calcium

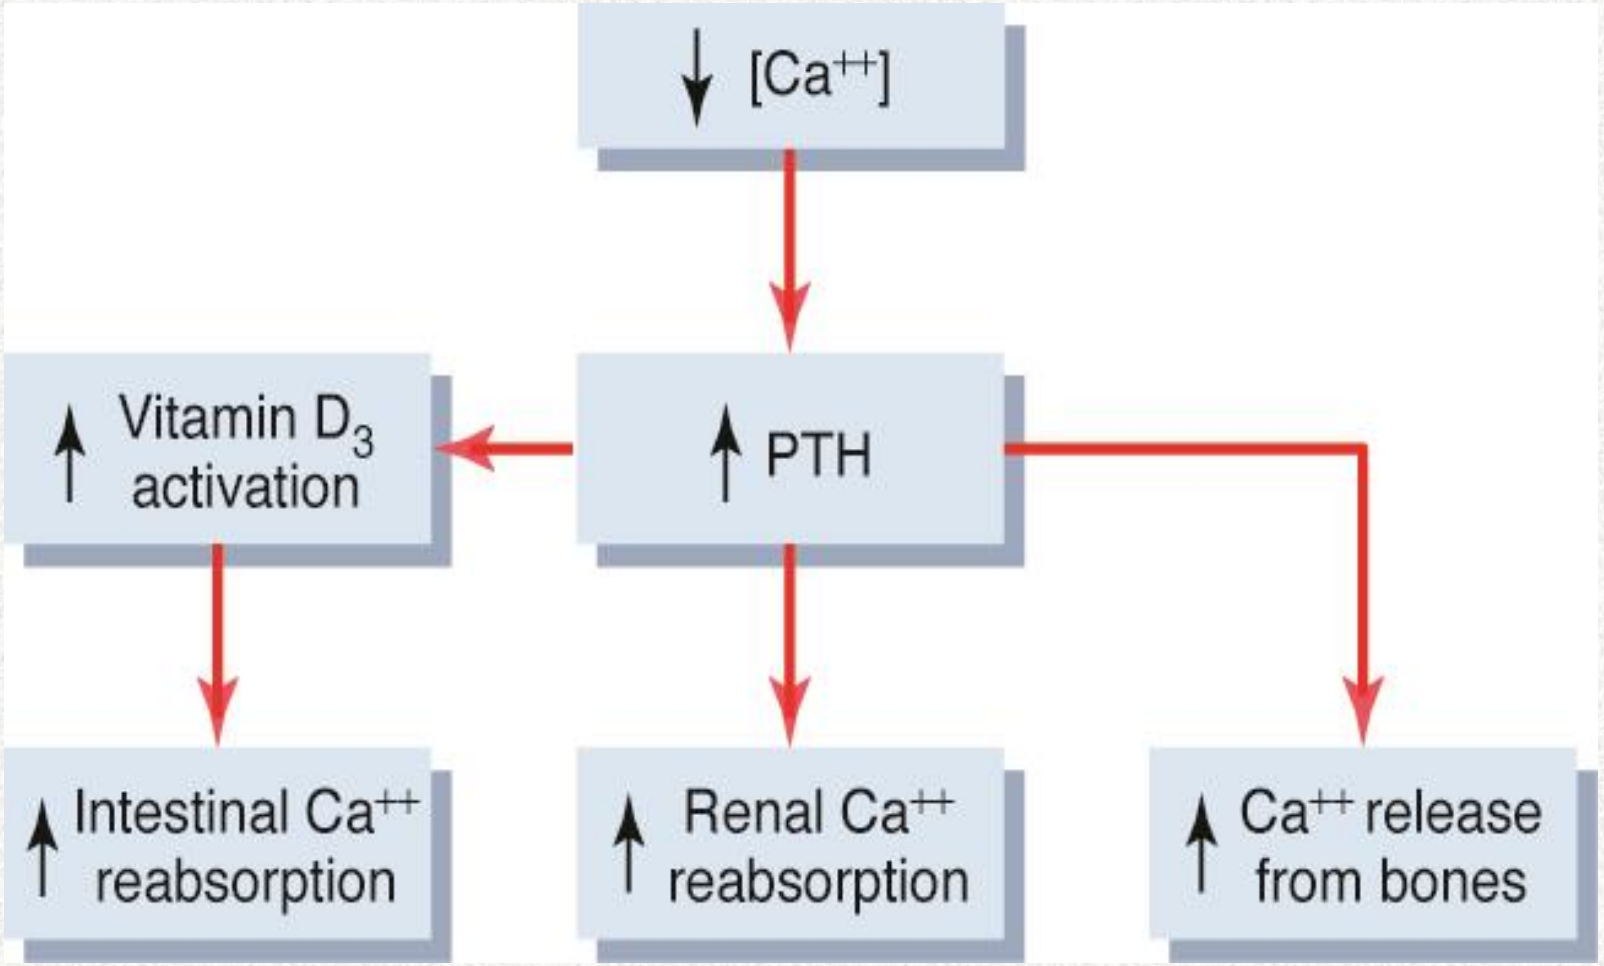


Figure 29-11

Proximal tubular calcium reabsorption

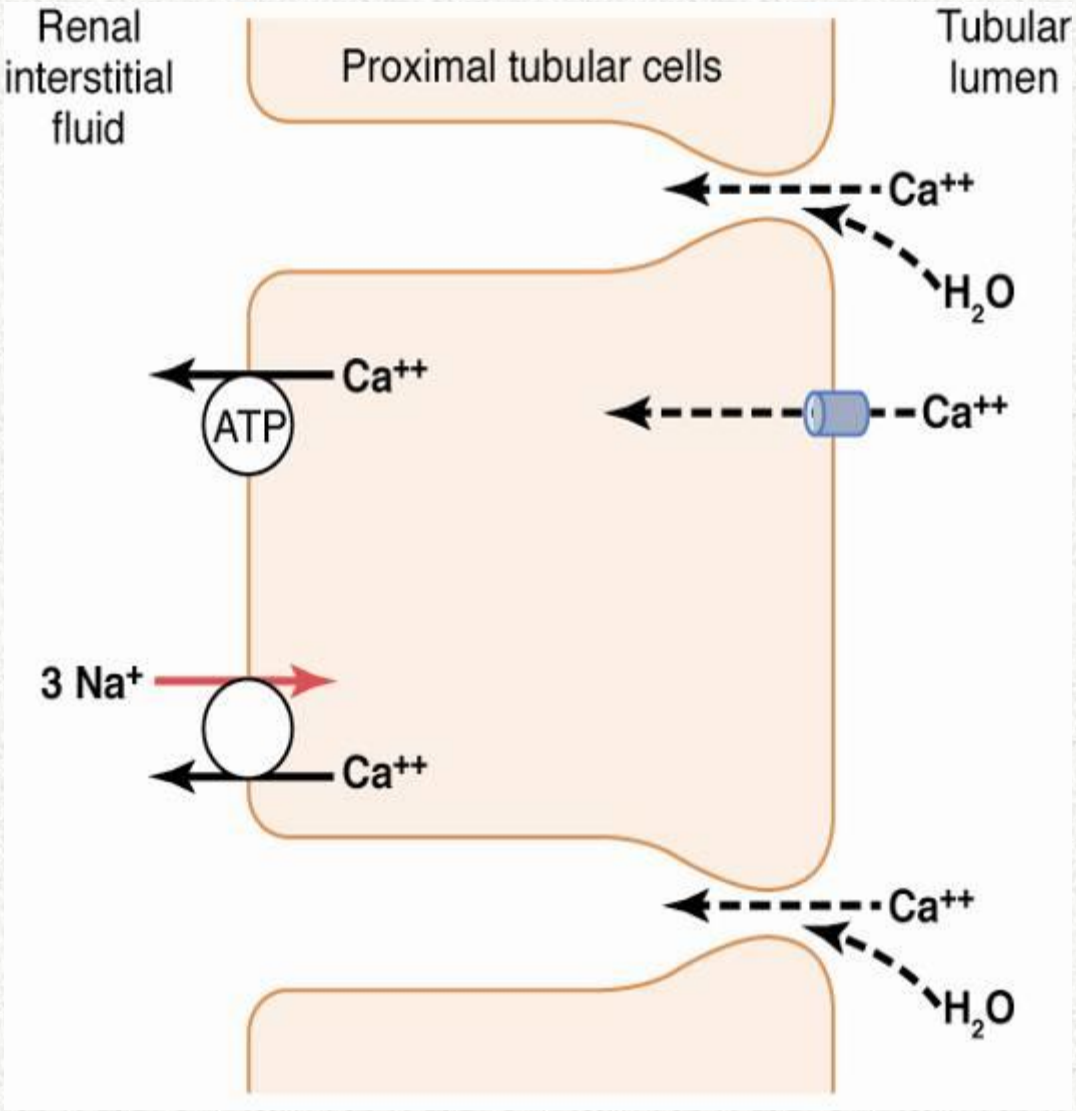

Figure 29-12

Integration of Renal Mechanisms for Regulation of Body Fluids

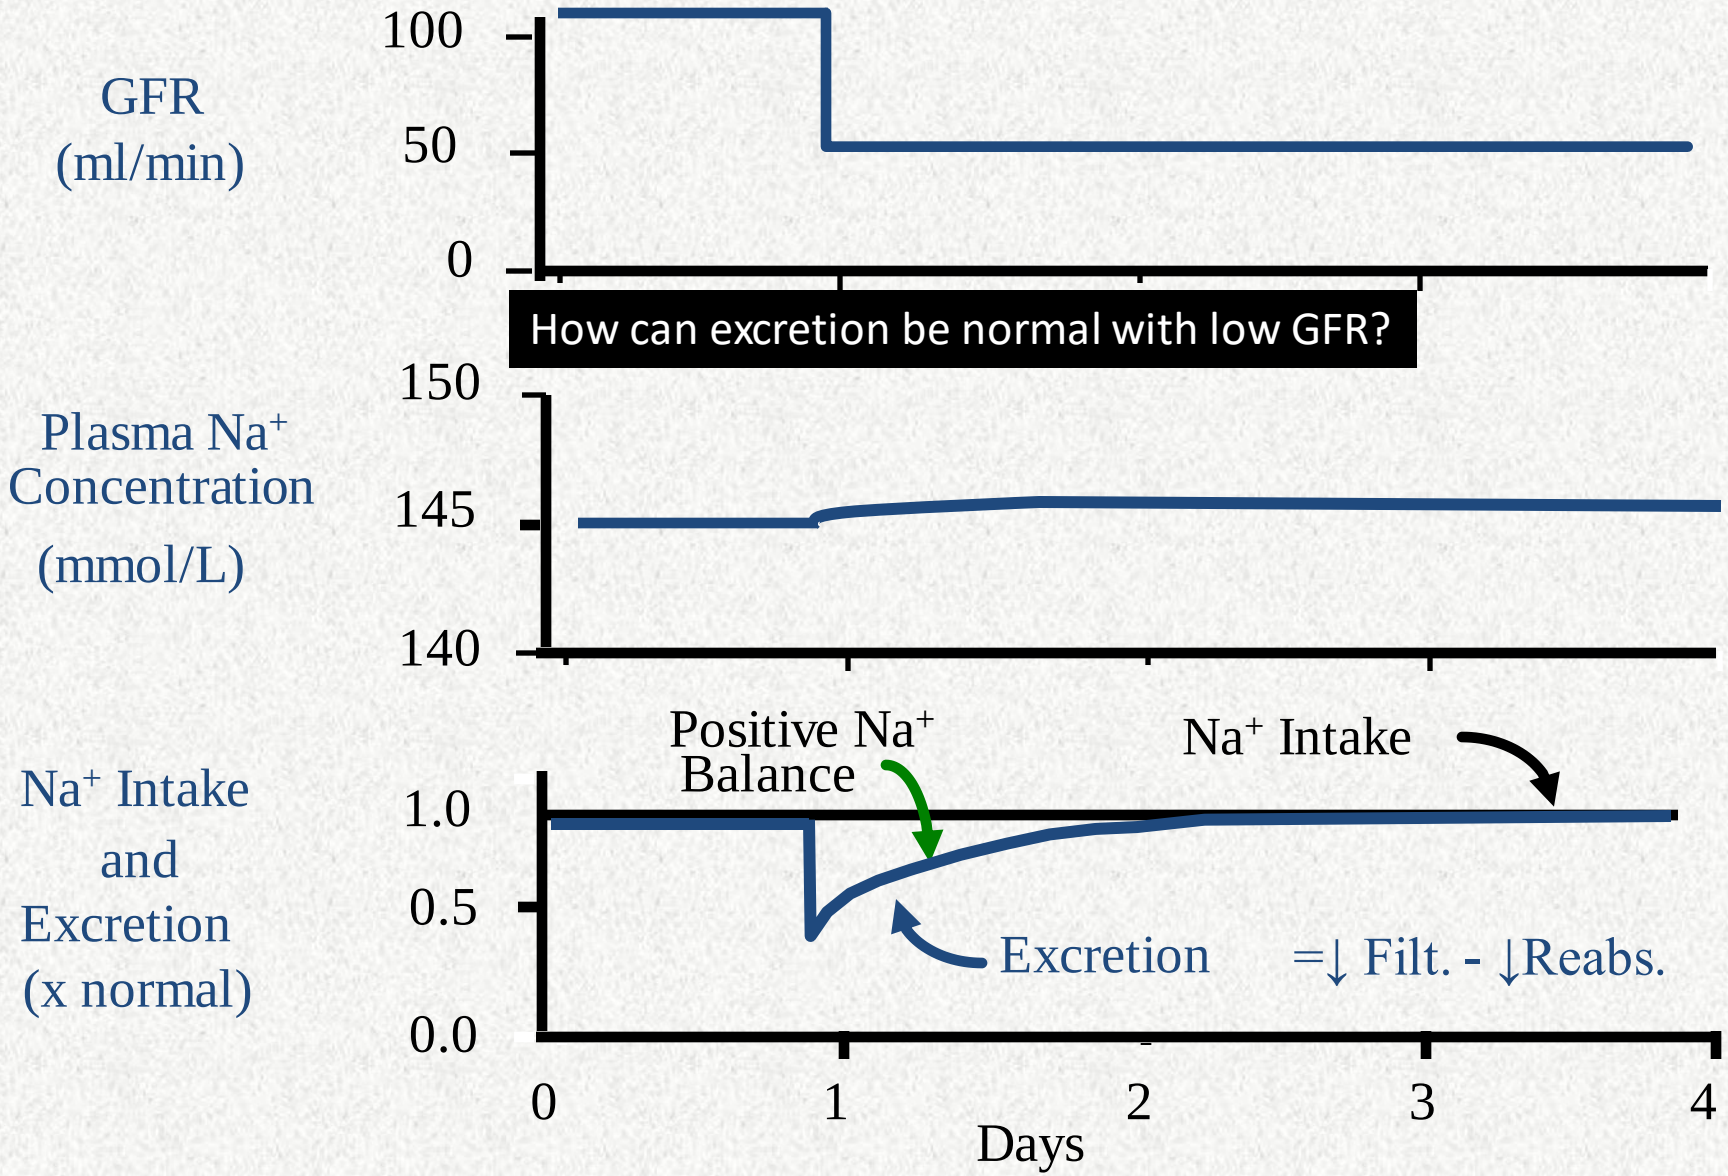
Excretion = Filtration - Reabsorption + Secretion

If there is a steady - state :

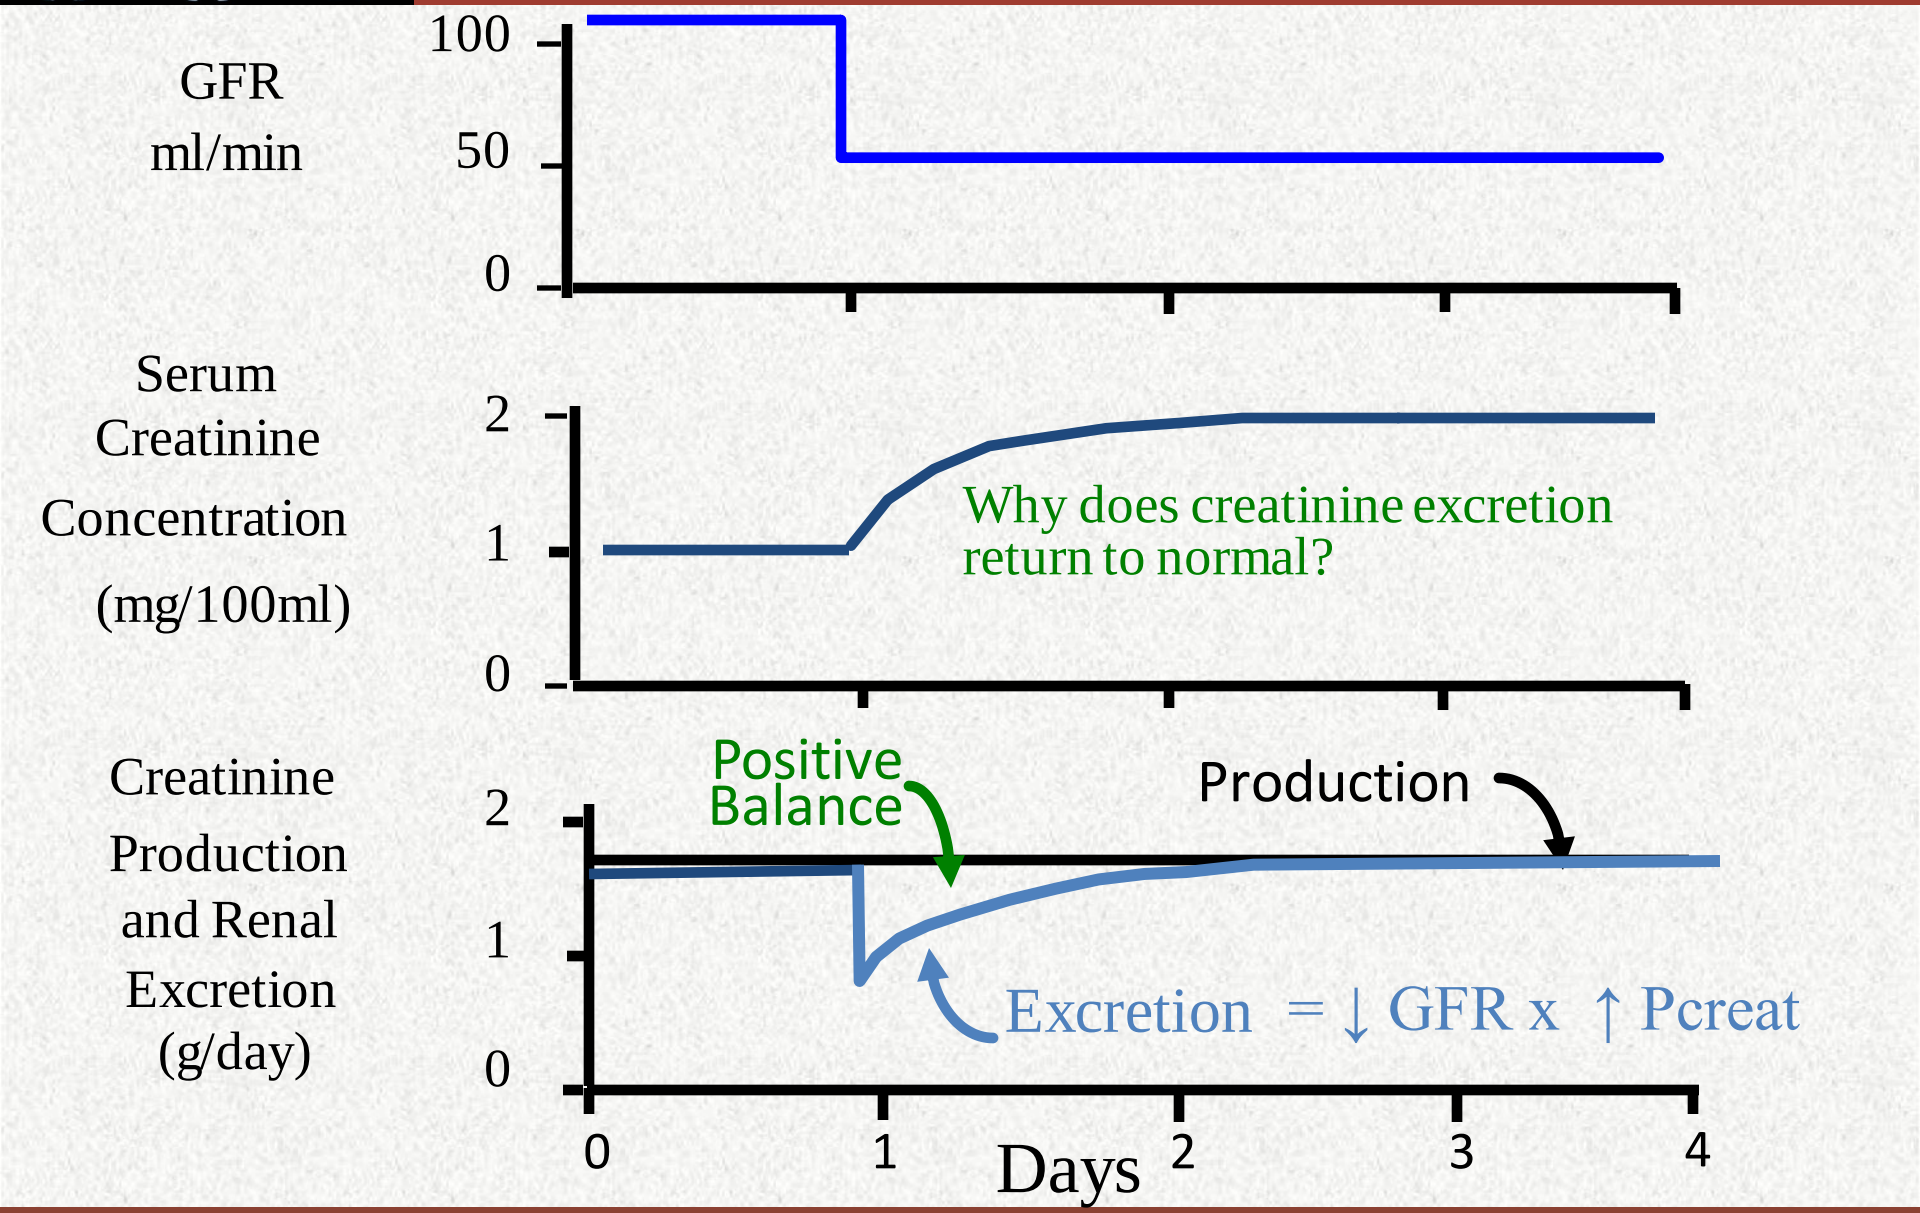
Fluid Excretion = Fluid Intake

Electrolyte Excretion = Electrolyte intake

Effect of Decreased GFR on Sodium



Effect of Decreased GFR on Creatinine



Plasma concentrations of solutes in chronic renal failure

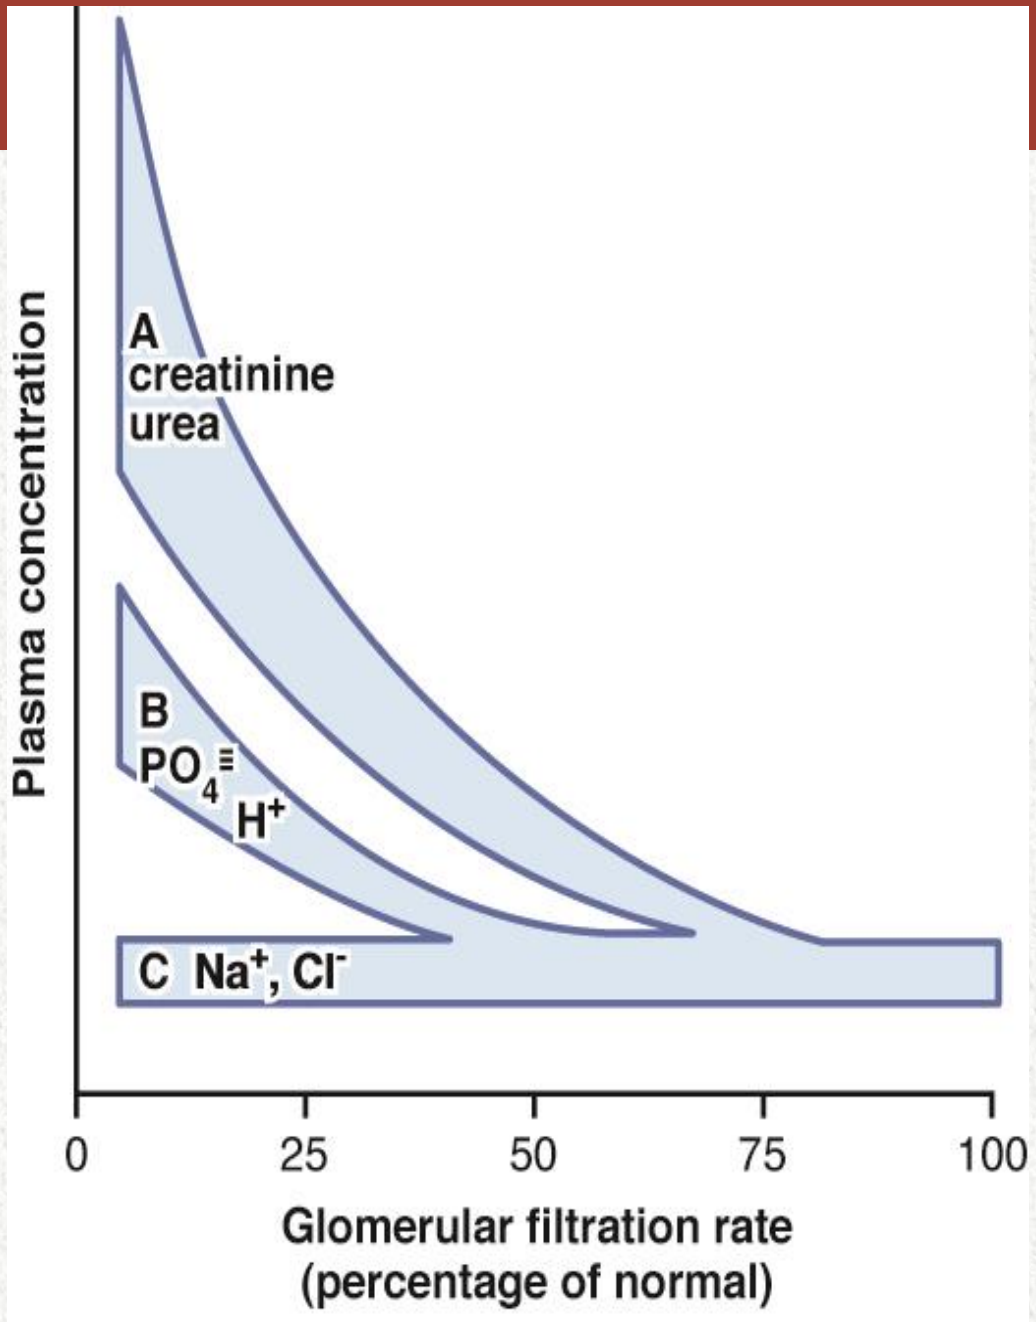


Figure 31-5

Hierarchy of Responses to Disturbances of Body Fluid Regulation

1. Local renal mechanisms
   - changes in GFR
   - changes in tubular reabsorption
   - changes in tubular secretion
2. Systemic mechanisms (which can affect the whole body)
   - changes in hormones
   - changes in sympathetic activity
   - changes in blood pressure
   - changes in blood composition

GFR

Proximal Delivery.

Tubulo-glomerular feedback

Reabsorption

Loop NaCl Delivery

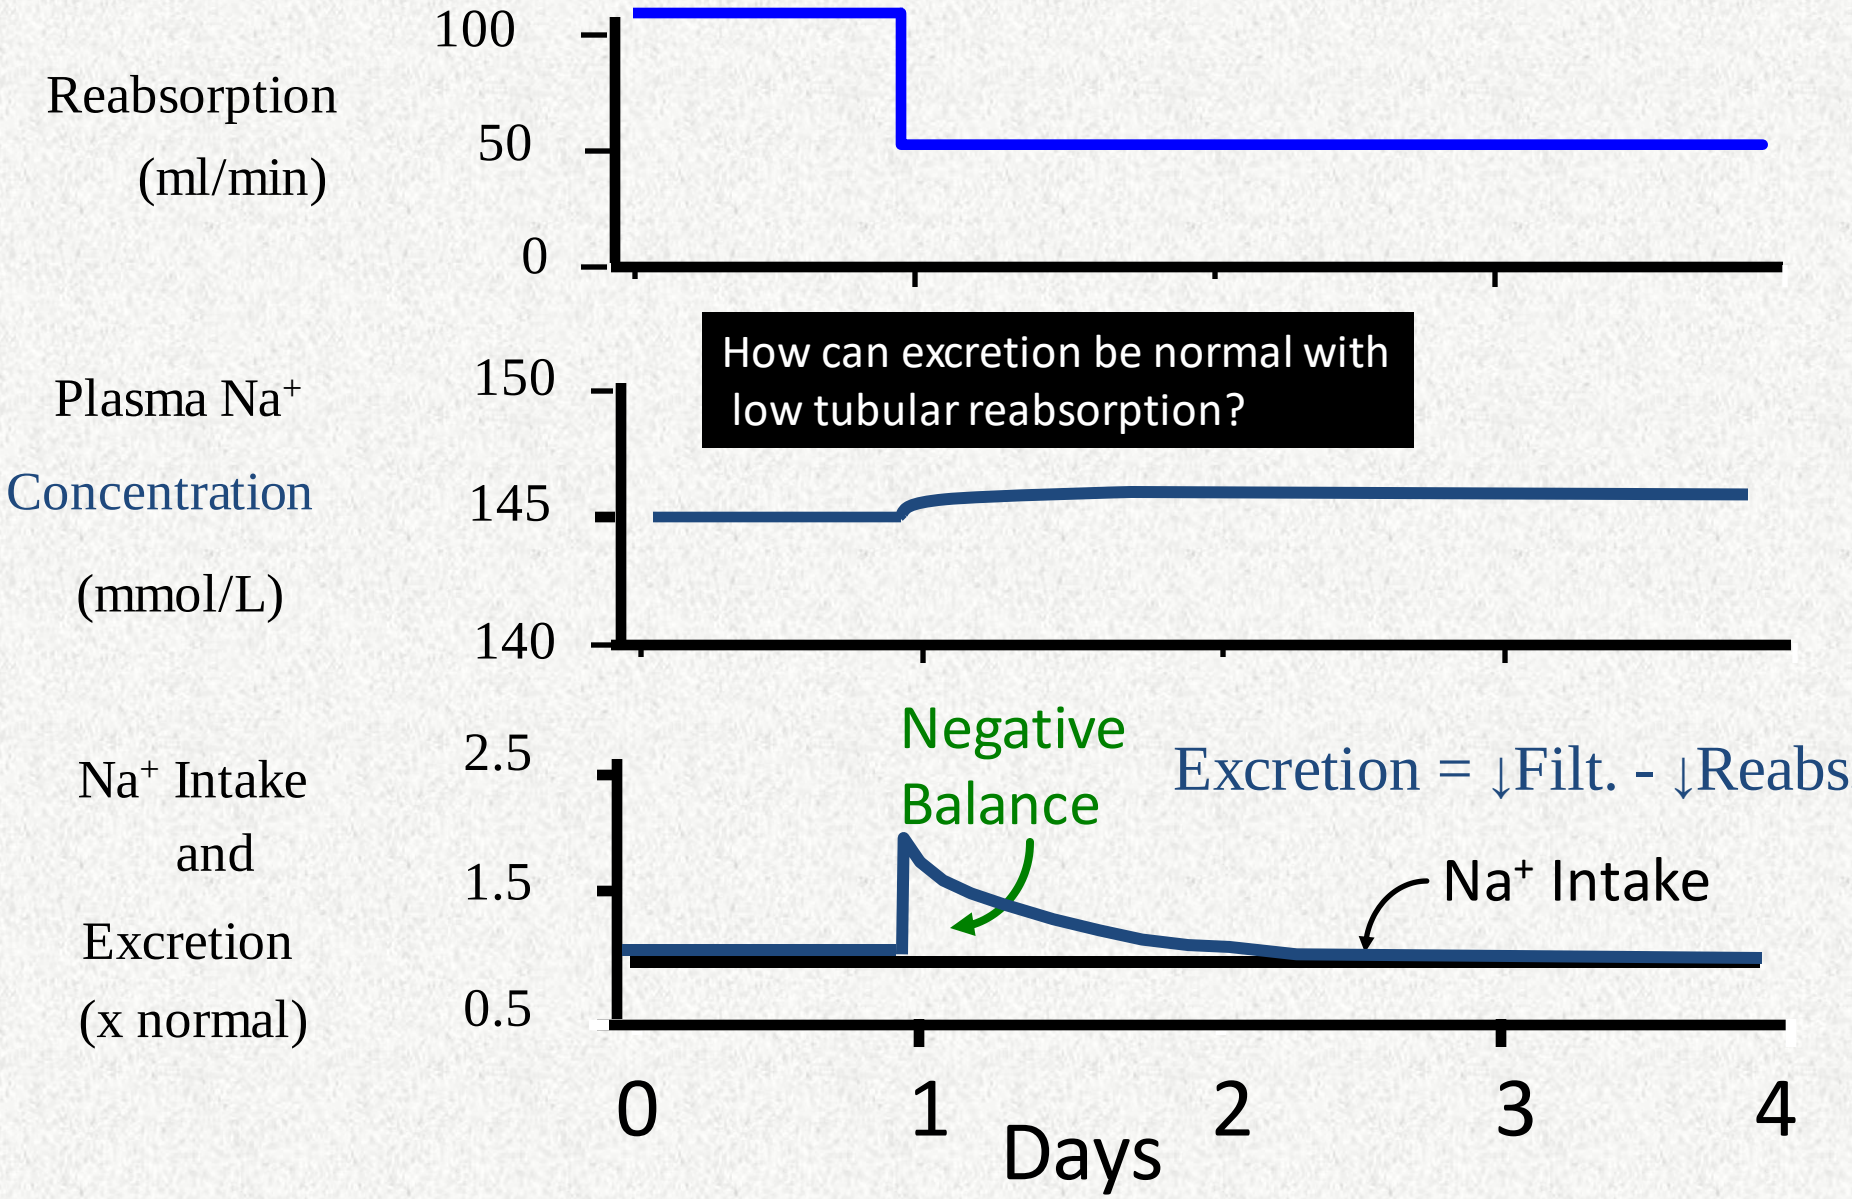
Glomerulo-tubular balance

Macula Densa NaCl Delivery

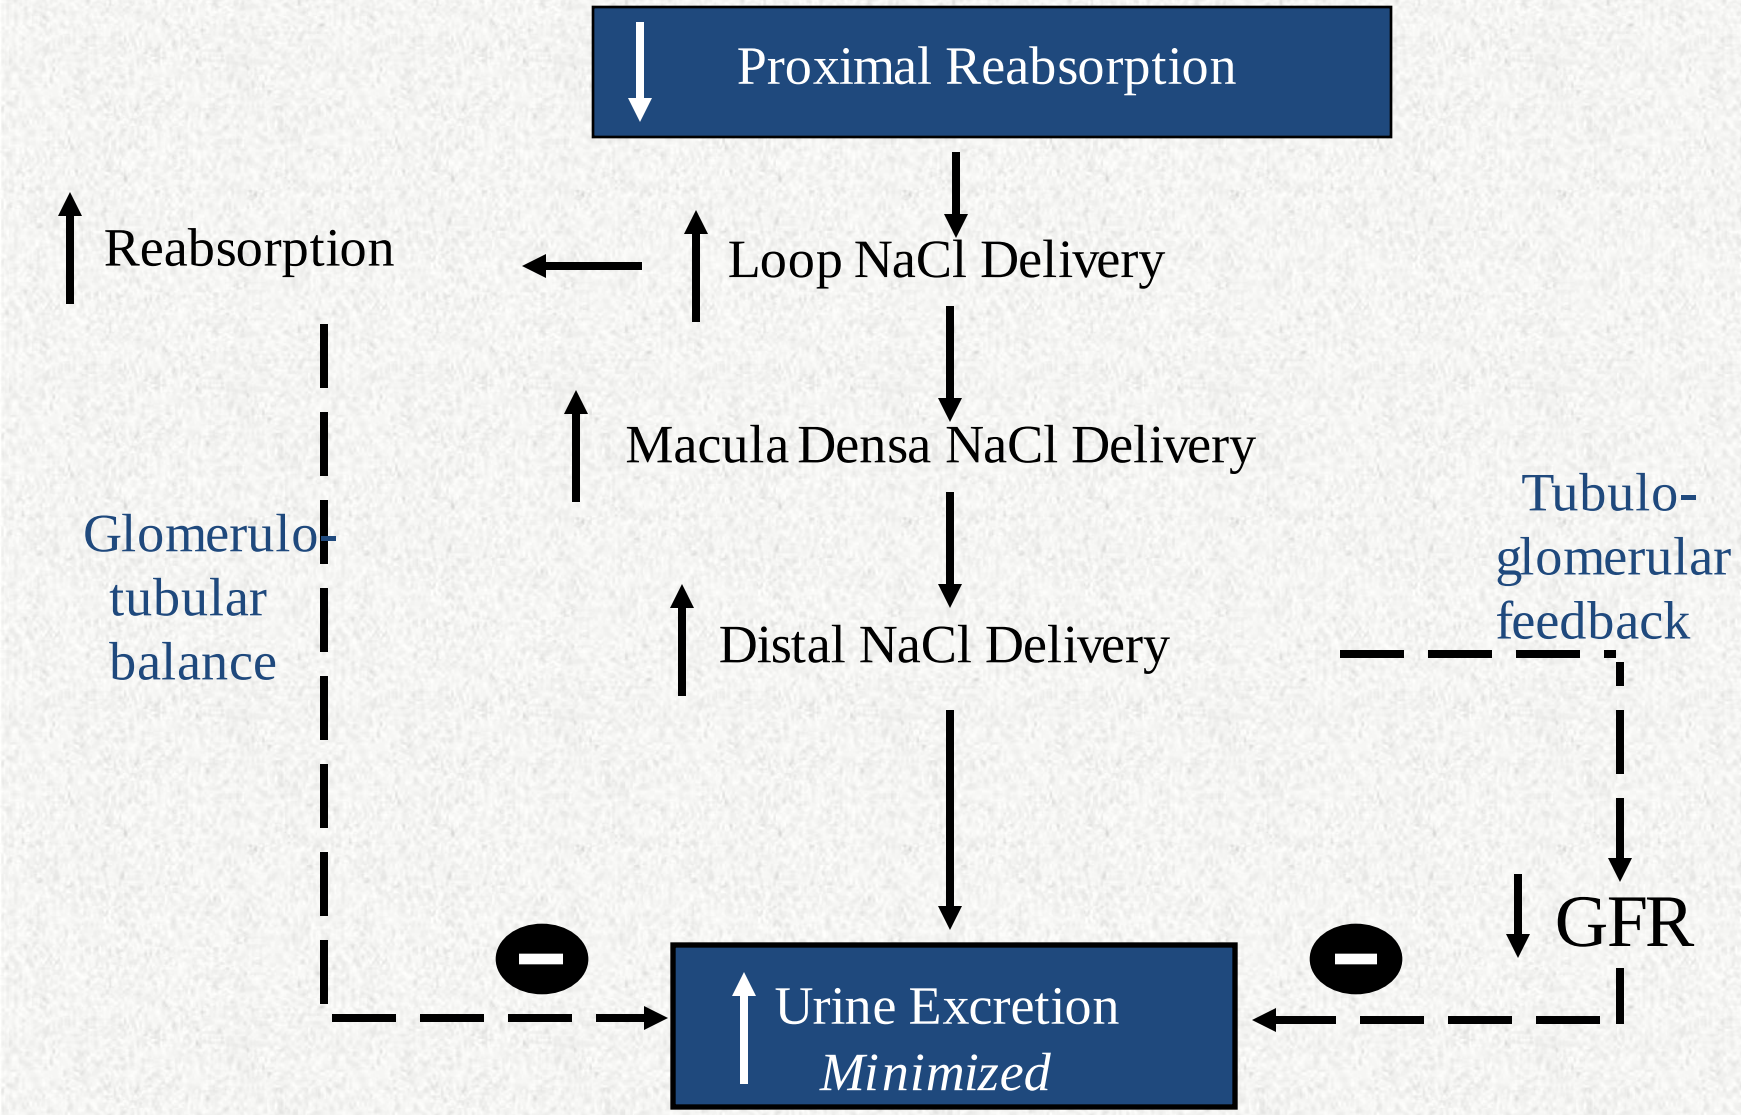
Distal NaCl Delivery

Urine Excretion
Na^+ *Minimized*

Effect of Decreased Reabsorption on Sodium Balance



Maintenance of Sodium Balance After Decreased Proximal Reabsorption



Hierarchy of Responses to Disturbances of Body Fluid Regulation

In steady-state, Intake = Output

1. Local renal responses
   - changes in GFR
   - changes in tubular reabsorption
   - changes in tubular secretion

2. Systemic mechanisms (which can affect the whole body)
   - changes in hormones
   - changes in sympathetic activity
   - changes in blood pressure
   - changes in blood composition

Sodium excretion and extracellular fluid volume during diuretic administration.

Compensations that Permit Na^+ balance:

- ↓ blood pressure
- ↑ renin, angiotensin II
- ↑ aldosterone

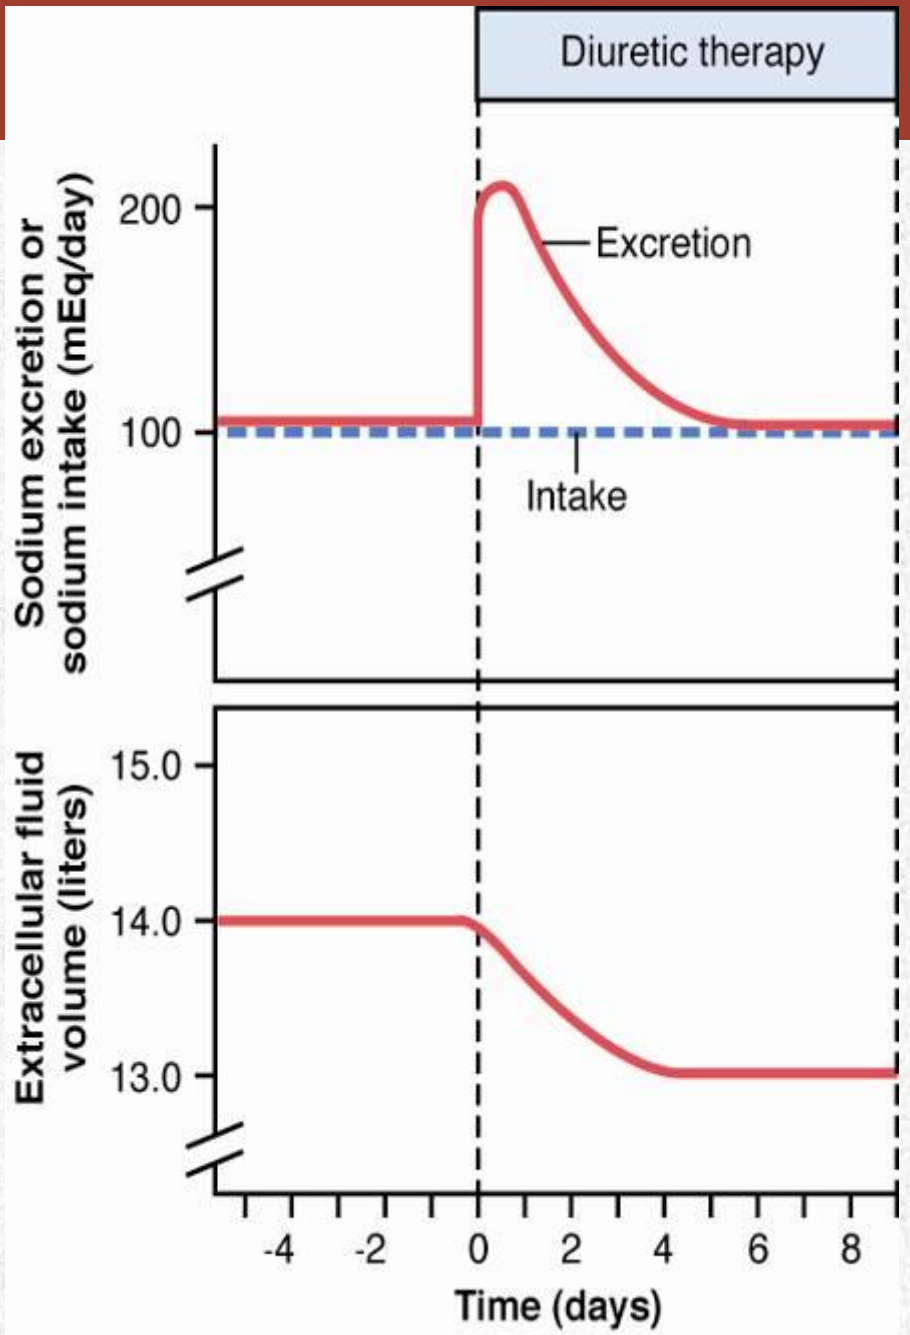


Figure 31-1

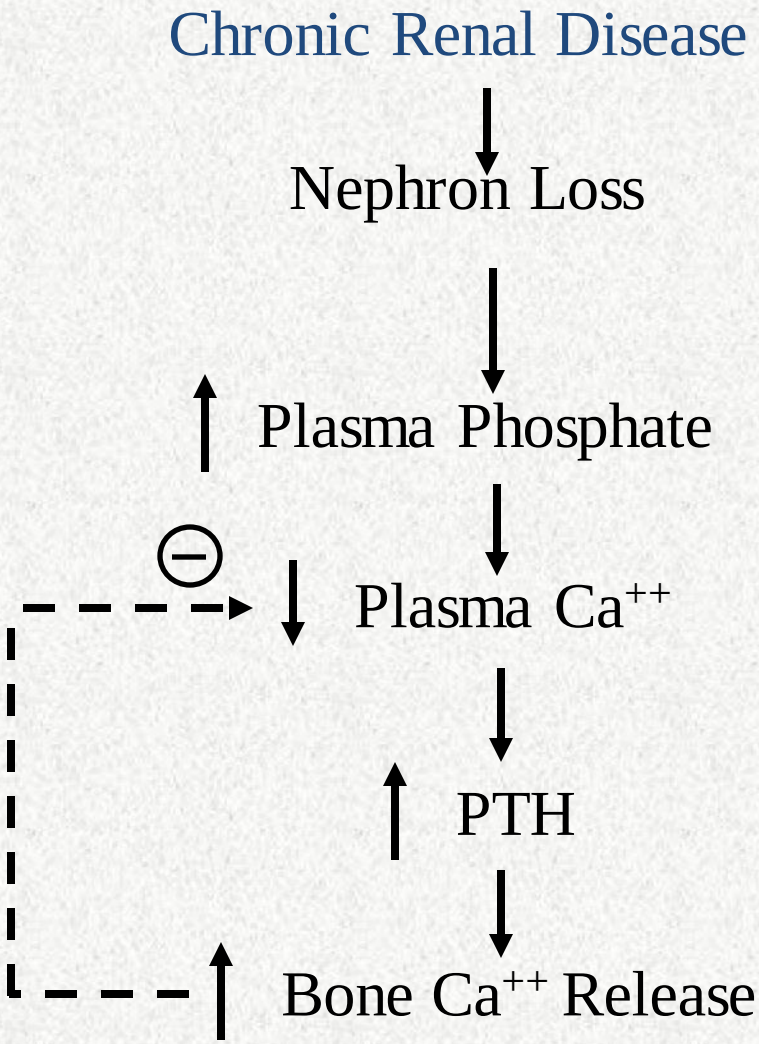
Hormonal Response to Chronic Renal Disease - PTH



(osteoporosis - brittle bones)

Hierarchy of Responses to Disturbances of Body Fluid Regulation

In steady-state, Intake = Output

1. Local renal responses
   - changes in GFR
   - changes in tubular reabsorption
   - changes in tubular secretion
2. Systemic mechanisms (which can affect the whole body)
   - changes in hormones
   - changes in sympathetic activity
   - changes in blood pressure
   - changes in blood composition

Renal-Body Fluid Feedback- Increased Fluid (Na^+) Intake

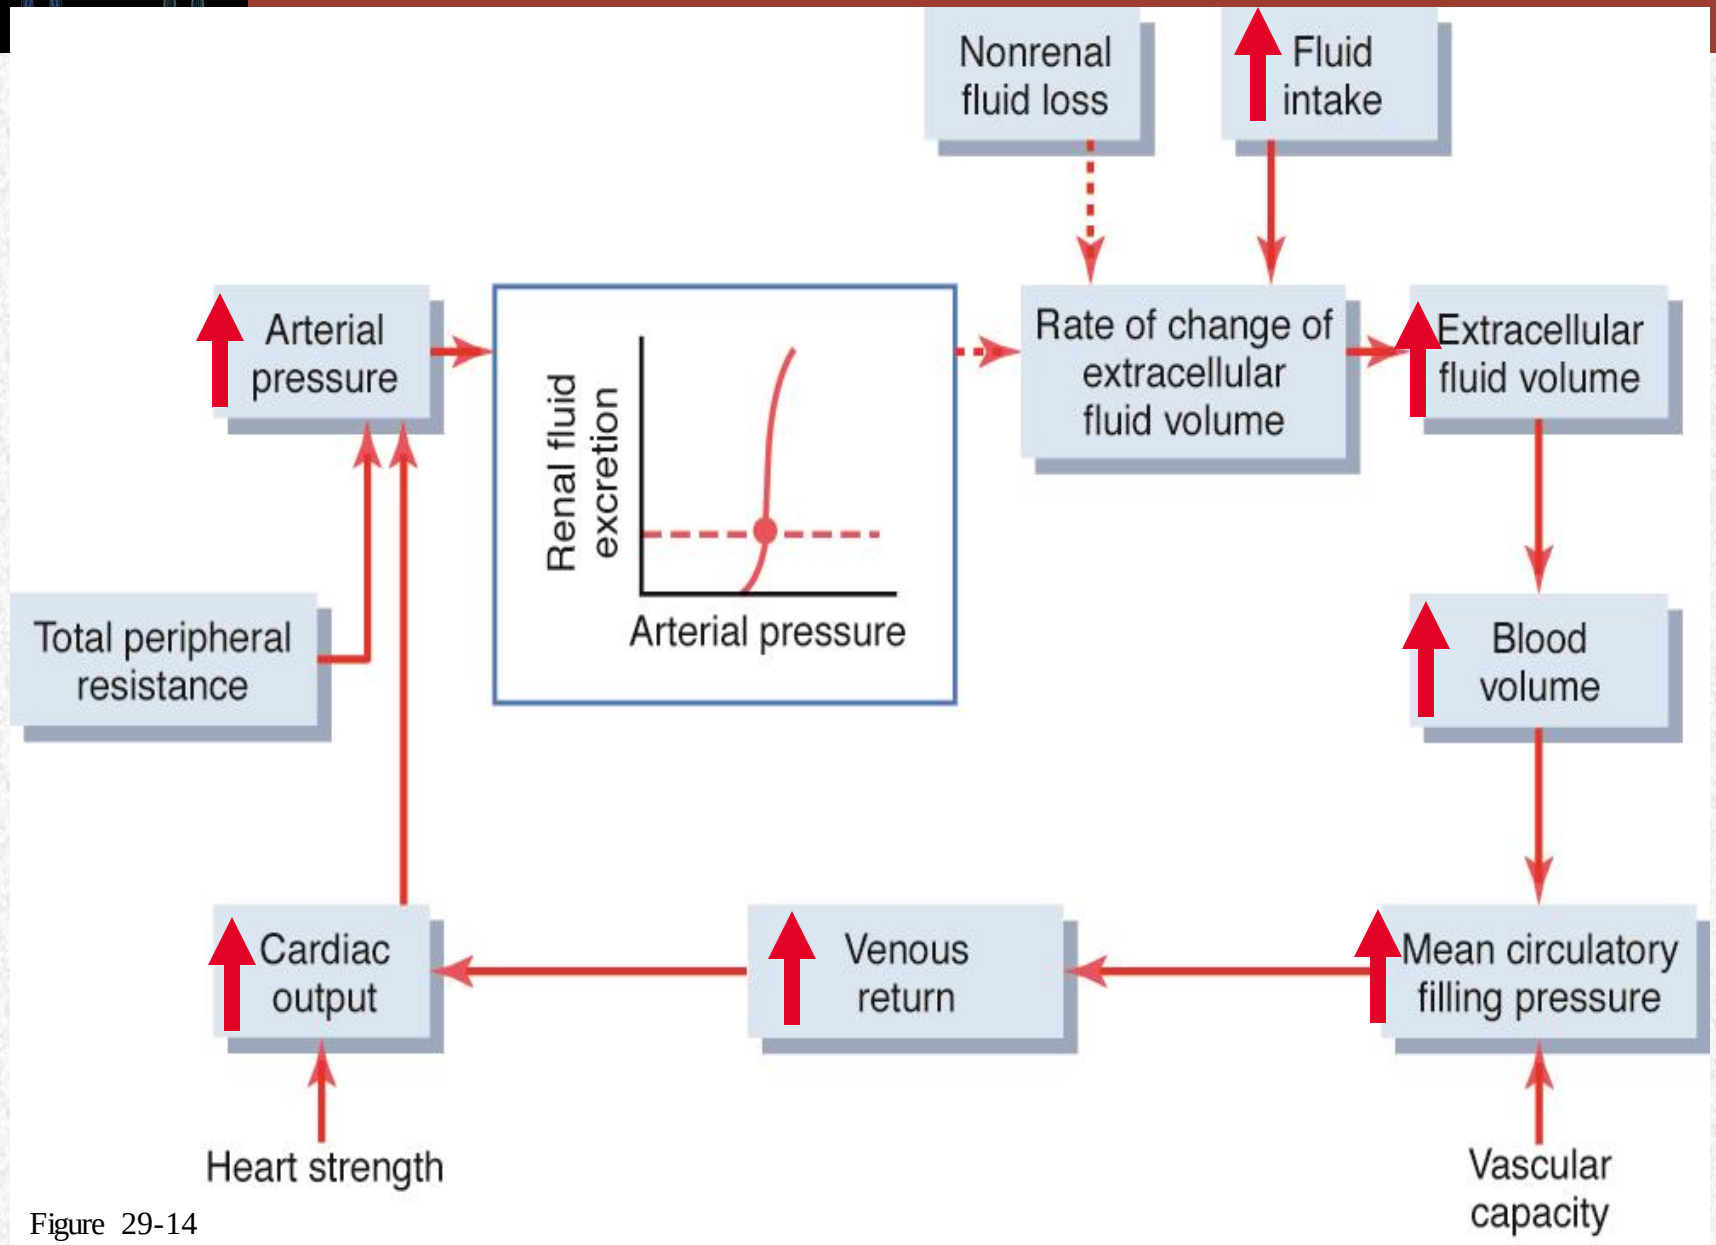


Figure 29-14

Integrated Responses to High Na^+ Intake

Excretion Na^+ = Filtration Na^+ - Reabsorption Na^+

1. Small increase in GFR
2. Decreased Na^+ Reabsorption is caused by:
   - small increase in blood pressure
   - increased peritubular capillary pressure
   - decreased angiotensin II
   - decreased aldosterone
   - Increased natriuretic hormones (e.g. ANP)

Net effect = increased Na^+ excretion
